4 **Abstract**
5

6 COVID-19 created significant challenges in crisis management worldwide,
7 especially for local governments that needed to communicate with citizens about
8 health risks, policy decisions, and real-time information related to the pandemic. We
9 analyse the evolution of the engagement between citizens and local governments on
10 Twitter during the different phases of the first wave of the pandemic in Latin
11 America, employing social media intelligence techniques to analyse 106,925 tweets
12 from 103 local governments. Our results show enhanced engagement, especially in
13 participation and collaboration, during the phases studied. Moreover, the increased
14 use of social media as a communication channel was associated with mobility
15 restrictions during the pandemic. Our research contributes to a deeper understanding
16 of the role of social media as a communication channel between governments and
17 citizens in the different phases of crisis management.

40 **INTRODUCTION**
41

42
43 Crises caused by natural and man-made events have increased in different parts
44 of the world in recent years, causing human, economic, and social consequences for the
45 affected people (Ogie et al., 2022; Singla and Agrawal 2024). The importance and
46 impact of these events have sparked interest in analyzing them (Fauzi, 2023) to address
47 various needs of society. Furthermore, crisis management requires governments to
48 control the situation and to provide solutions to citizens and others affected, including
49 the capacity of the public administration to manage the information during emergencies
50
51
52
53
54
55
56
57
58
59
60

1
2
3
4 (Li, Chandra, and Kapucu 2020). Governments must generate closeness with citizens in
5
6 crisis by disseminating information that demonstrates commitment (Padeiro, Bueno-
7
8 Larraz, and Freitas 2021).
9

10
11 In crisis management, communication is essential because it provides real-time
12
13 information about the situation and related decisions (Kim, Bae, and Hastak 2018;
14
15 Rizza, 2023; Zhang et al. 2019). Since the middle of the decade of 2000s, people have
16
17 used social media as a communication channel during disasters (Reuter and Kaufhold
18
19 2018; Singla and Agrawal 2024) through the access and use of official government
20
21 social media accounts to the participation and interaction of citizens in crisis
22
23 management (Guo et al. 2021; Ogie et al. 2022).
24
25

26
27 For this purpose, social media has become a relevant communication channel for
28
29 attending emergencies (Lam et al. 2023; Singla and Agrawal 2024). The COVID-19
30
31 pandemic created significant challenges for crisis management worldwide, affecting
32
33 citizens, governments, and organizations. It evidenced the necessity to inform the
34
35 citizens about the situation and maintain close communication with the affected in real-
36
37 time. For this reason, social media became a fundamental channel for crisis
38
39 management because of the rapid spread of the pandemic (Landi et al. 2022; Pérez-
40
41 Escoda et al. 2020), which required information and fast decisions, in the early stages of
42
43 the pandemic, many individuals, including government agencies, used social media to
44
45 present news and opinions related to the coronavirus (Manguri, Ramadhan, and Amin
46
47 2020) and allowed government authorities to issue and disseminate information at a
48
49 moment's notice of restrictive isolation measures (Zhu and Hu 2023).
50
51

52
53 Social media has brought about a significant change in the way governments
54
55 communicate with their citizens and access innovative stakeholder knowledge. These
56
57
58
59
60

1
2
3
4 tools have resulted in more efficient and effective processes and direct and fluid
5
6 communication with citizens, especially Twitter, which has been considered an
7
8 appropriate communication tool (Kumar and Jaiswal 2020). They are social media most
9
10 used by governments for local discussion (Haro-de-Rosario, Sáez-Martín, and Caba-
11
12 Pérez 2018) and citizen participation (Bonsón, Perea, and Bednárová 2019). However,
13
14 previous studies have shown that merely using social media for communication does
15
16 not necessarily guarantee effective engagement or interaction between governments and
17
18 citizens because two-way interactive communication often remains at an initial level
19
20 (Chen et al. 2020), although there are few studies related to the topic (Bonsón et al.
21
22 2019; Landi et al. 2022).

23
24
25
26 Given this context, we investigate the following research question: *How did*
27
28 *Latin American local governments engage with citizens on Twitter during the first wave*
29
30 *of the COVID-19 pandemic?* To answer this question, we analyse the scope of the
31
32 tweets of 103 local governments of 18 Latin American countries during the first half of
33
34 2020, representing 106,925 tweets. Our results show increased citizen engagement by
35
36 Latin American local governments on Twitter during the first wave of COVID-19, and
37
38 we probe collaboration levels by analysing the interactions between citizens and
39
40 government. Our research contributes to understanding how local governments report
41
42 information through Twitter during an unprecedented health crisis in a region with
43
44 socioeconomic difficulties that deepened during the pandemic. In addition, our study
45
46 contributes to the literature on crisis management communication and the practical
47
48 planning required for effectively responding to health and other emergencies.
49
50

51
52 The rest of the paper is structured as follows. After this brief introduction, we
53
54 present the literature review regarding social media in government-citizen
55
56 communication during crisis management. The third section describes the methodology,
57
58
59
60

1
2
3
4 including detailed tweet collection procedures, analysis techniques, and sample
5
6 selection. In the fourth section, we present the results and discuss them in the fifth
7
8 section. Finally, the sixth section presents the limitations, implications, and future lines
9
10 of research.
11

12 13 **LITERATURE REVIEW** 14

15 16 **Social Media in Crisis Management** 17

18
19 A crisis is a public event that threatens social systems and ethical values (Luo et
20
21 al. 2021). They are associated with natural hazards (tsunamis, hurricanes, cyclones,
22
23 earthquakes, floods) and man-made disasters (shootings, terrorist attacks, civil unrest).
24
25 Disasters have increased in frequency and intensity in recent years, causing human,
26
27 economic, social, and even psychological losses (Fauzi 2023; Ogie et al. 2022; Singla
28
29 and Agrawal 2024). Due to the impact of these events, crisis management (crisis or
30
31 disaster management as synonyms) has become a topic of interest to the authorities and
32
33 the public (Fauzi 2023) through effective and reliable communication (Guo et al. 2021;
34
35 Kapucu and Garayev 2016). Various actors participate in this communication to assess
36
37 the severity and impact of the events (Kim et al. 2018), including government agencies,
38
39 public organizations, victims, and volunteers (Chen et al. 2020; Guo et al. 2021; Padeiro
40
41 et al. 2021).
42
43
44

45
46 Although communication has been considered fundamental in crisis
47
48 management, it has proven challenging to have fluid communication between those
49
50 involved during emergencies. In this context, Information and Communications
51
52 Technology (ICT) have converted into an effective method to address the different
53
54 challenges related to communication, especially social media, which, in recent years,
55
56 has been widely recognized as a valuable tool for crisis management (Han et al. 2022;
57
58
59
60

1
2
3
4 Singla and Agrawal, 2024; Zhu and Hu, 2023). The literature highlights the research on
5
6 social media in crises (Fauzi 2023; Lam et al. 2023; Zhang et al. 2019) caused by events
7
8 such as wildfires, floods, storms, terrorist events, and others in different countries
9
10 (Padeiro et al. 2021; Stieglitz et al. 2022) and disaster management (Singla and Agrawal
11
12 2024; Zhang et al. 2019).
13
14

15
16 Social media facilitates quick and effective crisis response through
17
18 communication and coordination (Mori et al. 2021; Luo et al. 2021; Rizza 2023). It
19
20 helps convey warnings, prepare for events, and foster community bonds post-crisis
21
22 (Kim et al. 2018), allowing interested parties to collect and analyze information and
23
24 understand public attitudes (Abd-Alrazaq et al. 2020; Garcia and Berton 2021).
25
26 Platforms like Twitter are particularly suitable for emergencies due to their features
27
28 enabling virtual linkages and user collaboration (Fauzi 2023; Lam et al. 2023; Ruz et al.
29
30 2020). Twitter supports two-way content development and enhances interactions with
31
32 organizations (Landi et al. 2022; Sundstrom and Levenshus 2017), and it helps
33
34 governments increase openness and transparency (Yaqub et al. 2017).
35
36

37
38 In the case of public administration, governments have used social media
39
40 extensively for risk and crisis communication, keeping the public informed, countering
41
42 misinformation, addressing victims' families, and receiving external support (Han et al.
43
44 2022; Luo et al. 2021; Reuter and Kaufhold 2018; Guo et al. 2021). Therefore, social
45
46 media have become a means for governments to explain, make decisions, and act in a
47
48 coordinated manner with citizens (Chen et al. 2020), considering that the information
49
50 released by government agencies allows for greater credibility among users because it is
51
52 subject to validation and verification (Zhu and Hu 2023), with cost-effectiveness and
53
54
55
56
57
58
59
60

1
2
3
4 advantages that other media cannot provide (Guo et al. 2021), even among emergency
5
6 response agencies and disaster-affected communities (Kim et al. 2018).
7
8

9
10 As a result, public and emergency management agencies widely use social
11 media (Guo et al. 2021). From the users' perspective, social media and traditional
12 channels are critical for staying informed and sharing experiences, especially during the
13 uncertain early stages of crises (Stieglitz et al. 2022). In this regard, the citizens use
14 government social media accounts to facilitate communication because these
15 applications allow “a user to comment on a post, share (repost) a post, click the like
16 button on a post, or simply save (bookmark) the post for future reference” (Guo et al.
17 2021, 3).
18
19
20
21
22
23
24
25
26

27 Despite the advances in the study of social media in public administrations
28 (Guillamón et al. 2016) and research that has highlighted the importance of social media
29 in crisis management (Landi et al. 2022; Padeiro et al. 2021), there is a paucity of
30 research on public disclosure of government information crises (Guo et al. 2021).
31
32
33
34
35
36

37 **Management Crisis During COVID-19 In The Social Media Era**

38
39 The crisis has increased in recent years for multiple causes and in different
40 geographical areas (Fauzi 2023; Ogie et al. 2022; Singla and Agrawal 2024). It has
41 implied the leadership of national and local governments and emergency authorities to
42 manage the situation and received international support from countries and
43 organizations. However, COVID-19 was a crisis unprecedented in the last century due
44 to its duration (Zeemering 2021), its rapid spread, magnitude, and global impact, which
45 obligate to the governments quickly make decisions to control the emergency (Kruspe
46 et al. 2020; Padeiro et al. 2021), especially for the signals of alarm in the world and
47
48
49
50

53
54
55
56
57
58
59
60

1
2
3
4 confined measures of people in your homes in most countries to mitigate the spread of
5
6 the virus (Pérez-Escoda et al. 2020).
7
8

9
10 One of the immediate effects during the emergence of COVID-19 was the
11 increase of social media use in crisis management (Pérez-Escoda et al. 2020) to obtain
12 information and receive guidance and get involved in decisions related to the crisis to
13 dialogic approach (Landi et al. 2022; Padeiro et al. 2021). Furthermore, social media
14 became “an opportunity to share information and engage with the public, and the
15 interactive characteristics of social media communication offer a lens on government
16 coordination” (Zeemering 2021, 2).
17
18
19
20
21
22
23
24

25 The local governments had to adapt quickly to the situation for service delivery
26 and decision-making and used social media to inform citizens about these issues
27 (Padeiro et al. 2021; Zeemering 2021) due to the pressure to regular communication and
28 collaboration between the community and other actors involved in the emergency
29 management (Zeemering 2021) to the closets level with daily activities of the citizens
30 and impact in the territories and people of the local government in comparison of the
31 national governments (Rocca et al. 2020), and capacity to influence in the dialogue and
32 participation between the citizens and governments (Gálvez-Rodríguez et al. 2018;
33 Haro-de-Rosario et al. 2018).
34
35
36
37
38
39
40
41
42
43
44

45 The COVID-19 pandemic posed unique challenges for Latin America, a region
46 with a substantial population and significant health and social management difficulties,
47 especially in urban areas (World Bank 2020). The pandemic’s economic impact
48 worsened issues in informal sectors and affected those with limited remote work options
49 (Hevia and Neumeyer 2020). Economic shocks included collapsing commodity prices,
50 capital flows, and tourism (Djankov and Panizza 2020). Effective government
51
52
53
54
55
56
57
58
59
60

1
2
3
4 communication was crucial to addressing citizens' needs and implementing support
5
6 policies. The health emergency led to a surge in internet usage, with around 430 million
7
8 users in 2020. Research on social media engagement in Latin America remains scarce,
9
10 with most studies focusing on developed countries like the United States, Spain, and
11
12 Italy (Bonsón et al. 2019; Haro-de-Rosario et al. 2018). It highlights the need to analyze
13
14 engagement in regions with different socioeconomic contexts where government
15
16 communication is vital, especially during emergencies like COVID-19 (Zhang, Chen,
17
18 and Lukito 2023).
19
20

21 22 **Dialogical Theory for Crisis Management in Social Media** 23

24
25 From a theoretical perspective, to explain the study of the relationship between
26
27 governments and social media, the dialogical communication is one most crucial
28
29 theoretical approach that allows explaining the creation and maintenance of online
30
31 social relationships (Gálvez-Rodríguez et al. 2018; Landi et al. 2022; Stone and Can
32
33 2020; Wang and Yang 2020) despite this, there is a lack of studies that relate the
34
35 dialogic communication theory and social media of public administration (Landi et al.
36
37 2022; Sáez Martín et al. 2015)
38
39

40
41 Dialogic Communication Theory (Kent and Taylor 1998; Taylor and Kent 2014)
42
43 considered that “two-way symmetrical communication’s theoretical imperative is to
44
45 provide a procedural means whereby an organization and its publics can communicate
46
47 interactively” (Kent and Taylor 1998, 323). According to Kent (2013), dialogic
48
49 communication requires, on the one hand, participation, where managers, leaders, and
50
51 professionals communicate with individual people rather than through collective
52
53 messages. On the other hand, more appropriate channels for members of the
54
55 organization and stakeholders to collaborate and interact freely, even if social media,
56
57
58
59
60

1
2
3
4 such as Facebook and Twitter, do not comply fully with that purpose. In crisis
5
6 management, dialogic communication allows the citizens and other users to have a
7
8 voice to communicate their needs and concerns and for governments to gather direct
9
10 information to manage the crisis (Zhu and Hu 2023), which is considered relevant to
11
12 improving resilience in disasters (Lam et al. 2023).
13

14
15 Dialogic communication can help organizations manage crises by allowing them
16
17 to connect with their stakeholders through real-time feedback on the information they
18
19 publish and engage in conversations (Bellucci and Manetti 2017; Manetti and Bellucci
20
21 2016). That support allows the interaction and discussions between the government and
22
23 citizens in a bidirectional way (Agostino 2013; Zhu and Hu 2023). From a perspective,
24
25 there is the “Pull strategy” that contributes to engagement to the extent that it allows
26
27 citizens to actively participate in the topics of interest, unlike the “Push strategy” that
28
29 aims at a traditional information mechanism (Mergel 2013).
30
31

32
33 Due to the above, the dialogic communication approach allows analysis of the
34
35 interactions between local governments and the participation or reactions of citizens
36
37 (Rocca et al. 2020) to understand the strategies of communication in social media with
38
39 the governments during the crisis of COVID-19. Previous studies have shown that
40
41 governments use social media mainly from a one-way communication logic (Padeiro et
42
43 al. 2021; Zeemering 2021) or a combination of the two strategies (Arshad and Khurram
44
45 2020).
46
47

48 49 **Engagement and Interaction Levels in Public Sector Social Media** 50

51
52 Research indicates that social media usage changes during crises, but specific
53
54 engagement behaviors during a global crisis like COVID-19 need to be better
55
56 understood (Azer, Blasco-Arcas and Harrigan 2021). Landi et al. (2022) demonstrated
57
58
59
60

1
2
3
4 that public agencies generated public participation through social media during COVID-
5
6 19 by enhancing communication to keep citizens informed and empowered, meeting
7
8 their information needs (Pesci, Costa, and Andreaus 2020). It led to a new
9
10 communication model where public agents achieved engagement levels comparable to
11
12 or even higher than specialized digital health media (Pérez-Escoda et al. 2020), and it
13
14 aligns with literature suggesting social media can provide operational and emotional
15
16 support during health crises, helping reduce citizens' uncertainty and anxiety (French
17
18 2011).

21
22 It has allowed us to identify social media's evolving role in emergencies, aiming
23
24 to enhance collaboration through information dissemination, relationship management,
25
26 and user expression (Rizza 2023). Scholars have increasingly analysed citizen-
27
28 government interactions during crises (Han et al. 2022; Reuter and Kaufhold 2018), as
29
30 well as the distribution of information on social media, which illuminates citizen
31
32 engagement with entities (Mergel 2013; Zavattaro, French and Mohanty 2015). This
33
34 scholarly interest underscores the growing importance of understanding communication
35
36 dynamics and engagement strategies between governments and citizens (Bonsón et al.
37
38 2019; Bonsón, Royo and Ratkai 2015; Guillamón et al. 2016).

41
42 Citizen engagement is known as citizens' participation or involvement in
43
44 political and social issues or public affairs (Agostino and Arnaboldi 2016; Bonsón et al.
45
46 2019; Haro-de-Rosario et al. 2018) for establishing a relationship between the
47
48 government and citizens, to 'becoming more accessible and transparent, lowering
49
50 barriers to interaction, and providing a low-cost means of information dissemination'
51
52 (Stone and Can 2020, 2). Additionally, it is known as 'an individual or collective
53
54 behaviour for resolving social problems in the community' (Bonsón et al. 2019, 482)
55
56 that improves public relations with a focus on citizens and ensures public agencies'
57
58
59
60

1
2
3
4 representation in all available channels (Mergel 2013). Hence, users want two-way
5
6 communication with entities to express their perceptions and to receive an appropriate
7
8 and real-time response; even so, the benefits of social media are not enough to generate
9
10 citizen engagement.

11
12
13 Additionally, Zavattaro et al. (2015) define digital engagement as citizen
14
15 participation in the government administrative system through social media at the local
16
17 level, using Mergel's (2013) framework as an analytical guide. This framework outlines
18
19 three ways that government entities and citizens interact via social media: **1)**
20
21 **transparency:** Social media represents agencies in online channels, providing
22
23 government information in the news feeds citizens frequently check; this seeks to make
24
25 information accessible to the public on widely used websites (Mergel 2013). **2)**
26
27 **participation:** Agencies go beyond unidirectional information flow to involve citizens
28
29 in communications, allowing interaction and feedback through social media to enhance
30
31 decisions' legitimacy (Grimmelikhuijsen and Feeney 2017). **3) collaboration:** The
32
33 highest engagement level, establishing a reciprocal relationship where public entities
34
35 and citizens interact and co-create government innovations. It encourages public entities
36
37 to respond to user content, address concerns, and collaborate in public affairs. This level
38
39 enhances exchange, collaborative work, and co-production of political and social
40
41 matters (Zavattaro et al. 2015). This progression signifies a shift from government
42
43 control to citizens as equal partners (Bryer 2013). This research applies these definitions
44
45 of transparency, participation, and collaboration through social media to understand
46
47 expressions of (digital) engagement.
48
49
50

51
52 Despite being a decade since Mergel's (2013) initial proposal on citizen
53
54 interaction via social networks, its theoretical framework remains relevant today. Local
55
56 governments consistently utilize platforms such as Twitter for transparent and
57
58
59
60

1
2
3
4 collaborative communication, with minimal changes to their functionality emphasizing
5
6 their ongoing usefulness. Current scholars frequently reference Mergel's framework
7
8 (Criado and Villodre 2021; Al Sulaimani and Ozuem 2022), demonstrating its
9
10 continued relevance, especially in critical areas like disaster management (Hondula and
11
12 Krishnamurthy 2024; Villodre and Criado 2020), notably during the COVID-19
13
14 pandemic (Lovari, D'Ambrosi and Bowen 2020).
15
16

17
18 Among the reasons for analysing the use of social media for public engagement,
19
20 we highlight the following: (1) the potential to improve public trust, accountability,
21
22 transparency, and participation (Williams et al. 2018); (2) contribute to citizens'
23
24 political knowledge (Skoric et al. 2016); (3) offer the possibility of changing the
25
26 traditional relationship between citizens and governments (Agostino 2013) and, (4)
27
28 encourage citizen participation in public decision-making (Gálvez-Rodríguez et al.
29
30 2018).
31
32

33 34 35 **METHODOLOGY**

36 37 **Sample**

38
39
40
41 The sample in this research comprises the seven principal municipalities
42
43 (capitals or most populated) of each Hispanic American country, 18 of 20 analysed
44
45 countries that conform to the Latin American zone. We excluded two Latin American
46
47 countries from our analysis. The first is Puerto Rico, an unincorporated territory of the
48
49 United States, where the U.S. Constitution applies partially (Torruella 2007). The
50
51 second is Brazil for two reasons: its official language is different from other Latin
52
53 American countries (it is Portuguese, not Spanish), and this country is considered an
54
55 outlier country in terms of the number of infections and response to the coronavirus
56
57
58
59
60

1
2
3
4 concerning the rest of the Latin American zone (Bandeira and Carranza 2020; Nacher et
5
6 al. 2021).
7
8

9 We selected the Latin American zone because it has socioeconomic
10
11 characteristics that differ from those analysed in previous studies. In this case, the
12
13 government has an essential role in meeting the needs of the inhabitants, especially in
14
15 the COVID-19 emergency that requires governmental support for communication to
16
17 resolve different difficulties. In addition, this region has high user numbers on social
18
19 media, and few studies are related to developing countries (Bonsón et al. 2019; Haro-
20
21 de-Rosario et al. 2018).
22
23

24 To answer the research question, we retrieved the Twitter accounts verified by
25
26 local governments. The account information was collected by following the Twitter
27
28 icon link on the official municipality website or the Twitter platform; we identified 103
29
30 verified Twitter accounts of the 126 municipalities considered in the sample. The
31
32 analysis period was the first six months of 2020, from January 1 to June 31, 2020,
33
34 representing different pandemic stages. We have divided these into the following
35
36 phases, as shown in Figure 1:
37
38

39
40 <<< Insert Figure 1 about here >>>
41
42

43 Although the period analysed is the first half of 2020, the duration of the phases
44
45 is different in each country. As shown in Table 1, each phase's start date differs
46
47 according to the event described previously in the phases. Phase 0 has the most
48
49 extended duration in days. It is followed by Phase 1, Phase 3, and Phase 2. Table 1 also
50
51 shows the countries that did not have confinement measures or undergone de-escalation.
52
53 For this reason, dividing the analysed period into phases was impossible. Thus, we have
54
55 two groups of countries: on the one hand, countries with phases (see Appendix 1),
56
57
58
59
60

1
2
3
4 which have applied confinement and de-escalation phases, and countries without phases
5
6 (see Appendix 2), which have not taken these measures.
7
8

9 <<< Insert Table 1 about here>>>
10

11 **Data extraction**

12
13
14 The data were collected in August 2020 using the OSINT tool Twint, an
15 advanced Twitter scraping tool written in Python that allows the scraping of tweets from
16 Twitter profiles without using the Twitter API (Zacharias and Poldi 2018). Applying
17 these social media intelligence techniques (SOCMINT), 100% of the original tweets of
18 each account are obtained, with their corresponding metadata. In this way, we received
19 106,925 tweets from the leading Latin American municipalities, and we will analyse the
20 reactions to these publications of their 12,504,358 followers.
21
22
23
24
25
26
27
28

29
30 Table 2 summarizes all the sample data separated by the countries' groups with
31 and without phases. Six countries that did not apply confinement measures represent 33
32 local governments' Twitter accounts with 14,717 tweets, to which their 552,262
33 followers should react. On the other hand, we analysed 12 countries with well-
34 differentiated phases corresponding to 70 local governments with verified Twitter
35 accounts, extracted their 92,208 tweets, and identified how their 11,952,096 followers
36 interacted.
37
38
39
40
41
42
43

44 <<< Insert Table 2 about here>>>
45

46 **3.3. Interaction analyses**

47
48
49
50 Once we had scraped the tweets, we analysed the data using the free R software
51 (R Core Team 2018) to understand how citizens interact with what their municipalities
52 disclose on Twitter. Before the analysis, the tweets were cleaned and checked for
53
54
55
56
57
58
59
60

1
2
3
4 duplicate entries using the R “tm” library (Feinerer, Hornik, and Meyer 2017), ensuring
5
6 the absence of duplicate tweets.
7

8
9 We assessed citizen participation as detailed in Table 3, employing the Twitter
10 metrics developed by Bonsón et al. (2019). These metrics are an adaptation of those
11 initially designed for Facebook (Bonsón and Ratkai 2013) and subsequently also
12 tailored for use on Instagram (Perea, Bonsón and Bednárová 2021). The previous
13 literature considers the popularity metrics for the favourite interaction, the commitment
14 metric for the comment interaction, and virality for retweeting.”
15
16
17
18
19
20

21
22 <<< Insert Table 3 about here>>>
23
24

25 Based on the framework proposed by Mergel (2013) for evaluating interactions
26 on social media in the public sector, which revolves around three fundamental
27 dimensions: transparency, Participation, and collaboration, we utilize the number of
28 interactions tweets receive to measure different levels of engagement. Considering the
29 relationship between Open Government metrics and social media metrics is essential, as
30 the effective use of social media in the governmental context contributes to Open
31 Government objectives (Grover and Kar 2020).
32
33
34
35
36
37
38
39

40 Therefore, Mergel’s comprehensive approach provides a complete framework
41 for analysing and understanding the interaction dynamics of social media in the public
42 sector. In the transparency dimension, the aim is to provide educational information
43 through a unidirectional push approach, measuring transparency through the number of
44 tweets without interactions and seeking to build trust in accountability. In the
45 Participation dimension, active engagement of the public is pursued through a
46 bidirectional pull approach, evaluating interactions on Twitter such as retweets, likes,
47 and replies to achieve consultation, deliberation, and satisfaction. Lastly, the
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3
4 collaboration dimension focuses on fostering cross-border action, using bidirectional
5
6 interactivity tactics such as networking and co-design of services by responding to
7
8 citizens' tweets, with the desired outcome of building online communities and thematic
9
10 networks.

11
12
13 Figure 2 explains the process followed to classify a tweet into the three levels of
14
15 interaction. The process begins by identifying whether a tweet is posted to generate
16
17 collaboration. In this case, this will be when the tweet in question is a tweet that
18
19 responds to a previous tweet. On the other hand, if it is an original initial tweet, it will
20
21 be included in the levels of participation or transparency according to its interaction
22
23 number. If the tweet receives more than three retweets, likes, or replies, we will treat it
24
25 as generating participation. However, if the tweet gets fewer interactions, it has been
26
27 tweeted to grant transparency. In this way, we can classify tweets into three levels of
28
29 interaction: (1) transparency, the most basic level of interaction; (2) participation, the
30
31 medium level; and (3) collaboration, the highest level of engagement.
32
33

34
35 <<< Insert Figure 2 about here >>>

36
37
38 As indicated in Figure 3, depending on the levels of interaction, it is implied
39
40 whether it generates engagement or not. Transparent tweets do not generate engagement
41
42 since they barely interact; on the other hand, participatory tweets generate engagement
43
44 through many interactions. The case of collaborative tweets is peculiar because they
45
46 may or may not generate engagement: it is not possible to know this since, to reach this
47
48 level, the interactions are not considered, if not their purpose of publication: if it has
49
50 been tweeted to respond to a previous tweet or if it is an original tweet.
51

52
53 <<< Insert Figure 3 about here >>>

54 55 56 **RESULTS**

1
2
3
4 In this section, we explore the evolution of engagement and interactions on
5
6 Twitter by local governments in Latin America during the first wave of the pandemic.
7
8 We start with general statistical data from the sample of municipalities, including
9
10 demographic factors like population size and social media engagement metrics such as
11
12 followers, penetration index, and tweets (Table 1). We also analyse the frequency of
13
14 daily tweets by local governments across different pandemic phases to contextualize our
15
16 findings.
17
18

19
20 Next, we focus on the evolution of engagement and interactions on Twitter. By
21
22 examining trends in engagement metrics and interaction patterns between local
23
24 governments and citizens, we aim to understand how communication dynamics
25
26 unfolded during the pandemic's early stages. This analysis will shed light on the
27
28 effectiveness of local governments' communication strategies and their ability to foster
29
30 meaningful engagement with the public during a crisis, contributing to a deeper
31
32 understanding of social media's role in government-citizen interactions.
33
34

35 **Contextual Background: demographics and social media activity**

36
37
38 Table 4 compares local governments with and without confinement measures
39
40 (with and without phases, respectively). Local governments without confinement have
41
42 an average population of 769,973 inhabitants, while those with confinement have
43
44 1,157,420 inhabitants, a 33.47% increase. Additionally, local governments with
45
46 confinement have 90.20% more Twitter followers (170,744) than those without (16,735
47
48 followers). The population penetration of following official Twitter accounts is higher
49
50 in countries with phases (14.75%) versus those without (2.17%).
51
52
53
54
55
56
57
58
59
60

1
2
3
4 The number of tweets published is also higher in municipalities with
5
6 confinement phases, averaging 1,317 tweets compared to 446 tweets in those without
7
8 phases.
9

10
11 <<< Insert Table 4 about here>>>
12

13
14 Regarding tweeting activity during different phases, Table 5 shows that local
15 governments tweeted the least before the first COVID-19 case (Phase 0). Tweeting
16 increased to 583 tweets per day during the appearance of the first cases (Phase 1),
17 slightly decreased during the complete lockdown (518 tweets per day in Phase 2), and
18 rose to 671 tweets per day during the easing of lockdown (Phase 3), representing a
19
20 73.58% increase in daily tweets from Phase 0 to Phase 3.
21
22

23 <<< Insert Table 5 about here>>>
24
25

26 27 28 29 30 **Citizens' engagement**

31
32 Table 6 shows that citizen engagement with local government Twitter accounts
33 in Spanish-speaking countries averages 6.35 points. However, this varies significantly
34 between countries with and without containment measures. Engagement is higher in
35 countries without phases (8.93 points) than those with phases (5.13 points).
36
37
38
39
40
41

42 <<< Insert Table 6 about here>>>
43
44

45
46 Further analysis of countries with phases reveals a bell curve in engagement
47 throughout the health emergency (Table 7). Early 2020 saw 3.39 engagement points,
48 which rose to 3.68 as the first COVID-19 cases appeared. Engagement peaked at 6.81
49
50 points during total lockdown and slightly decreased to 5.52 points during de-escalation.
51
52
53

54 <<< Insert Table 7 about here>>>
55
56
57
58
59
60

Twitter interactions in the local governments

Table 8 outlines Twitter interactions, measured by transparency, participation, and collaboration, in local governments with and without confinement measures.

<<< Insert Table 8 about here>>>

Transparency was most significant in municipalities of countries without phases, where 31.79% of tweets aimed to generate transparency. In contrast, municipalities with phases focused on participation, with 68.17% of tweets encouraging citizen involvement. Collaboration levels were slightly higher in countries without phases but remained similar across both groups, with 11-12% of tweets responding to citizens.

Table 9 examines interactions across different phases, highlighting transparency, participation, and collaboration trends in countries with confinement measures.

<<< Insert Table 9 about here>>>

The level of transparency has decreased from Phase 0 to Phase 3, where there was a slight increase in transparency compared to Phase 2. However, while the level of transparency decreased, the levels of participation and collaboration increased, except in Phase 3, where participation decreased slightly compared to the previous phase. On the other hand, collaboration increased smoothly without reduction in any of the phases.

At the difficult time of the first wave of the pandemic, in Phase 2, the sample showed the most minor level of transparency but obtained the highest level of participation. Collaboration will increase slightly more in Phase 3, considerably reducing the difference between the levels of transparency and collaboration. The level of collaboration approaches that of transparency in this phase. This difference before the appearance of the first case of a patient with COVID-19, Phase 0, was quite marked.

1
2
3
4 Before the start of the pandemic (Phase 0), the local governments hardly
5
6 collaborated and were mainly dedicated to generating participation and transparency;
7
8 however, with the beginning of the confinement (Phase 2) and subsequent lockdown
9
10 easing (Phase 3), the local governments reached a greater collaboration by having to
11
12 respond to their citizens, abandoning tweeting to generate transparency.
13
14

15 DISCUSSION

16
17
18 In the study of social media, several aspects of interest stand out: firstly, the
19
20 engagement analysis has become a topic of interest for researchers to analyse the
21
22 interactions between different users (Bonsón et al. 2015; Haro-de-Rosario et al. 2018).
23
24 Secondly, Twitter has gained popularity recently because it allows users to express their
25
26 opinions concisely and in real-time on different topics, and it is relevant for analyzing
27
28 public interest issues (Stone and Can 2020). Thirdly, although regions such as Latin
29
30 America have gained ground in the use of social media and citizens are using these tools
31
32 to stay informed and share opinions on social or political issues (Gálvez-Rodríguez et
33
34 al. 2018), there are few studies related to interactions in social media in this region in
35
36 terms of disaster management. Finally, COVID-19 changed communication between
37
38 people, and there has been an increase in the use of social media during health
39
40 emergencies. It has become a means of communication for users to receive related
41
42 information (Pérez-Escoda et al. 2020).
43
44
45

46 In this study, we analysed 103 capital local governments in Latin America with
47
48 active Twitter accounts, highlighting that it is a sample with differences in the number
49
50 of inhabitants, activity (number of messages), audience (number of followers), and
51
52 interaction (likes, comments, and replies) and decisions related with the management of
53
54 COVID-19 (with phases or without phases). This result shows that most Latin American
55
56 local governments, 81.75% (103/126), are present on Twitter with an active official
57
58
59
60

1
2
3
4 account and that citizens recognize Twitter as a communication channel with a total
5
6 penetration rate of 11.74%. Additionally, Twitter demonstrates excellent potential for
7
8 amplifying messages regarding emergency management despite the limitations of social
9
10 media access for populations in different regions or socioeconomic levels. During the
11
12 analysis, citizen engagement in Latin America was 6.35, which is higher than the results
13
14 obtained in other studies on Twitter in different regions (Bonsón et al. 2019).
15

16
17 As indicated by Pérez-Escoda et al. (2020), the unprecedented health crisis
18
19 points towards a new communication model in health issues, creating a new space for
20
21 entities such as public agencies whose content achieves a level of engagement
22
23 comparable to or even higher than specialized digital media in health communication. In
24
25 this case, Latin American local governments do not match up to Italian local
26
27 governments as they are in an early stage of the process both in acquiring social
28
29 communication skills and in defining a communication strategy to strengthen their
30
31 social relationships (Mori et al. 2020). According to Zhang et al. (2019), disaster
32
33 management agencies that effectively use social media are the ones who listen to the
34
35 public. Furthermore, due to restrictions on people's mobility during COVID-19, social
36
37 media became the preferred channel for people to communicate with people close to
38
39 them and to find out about the decisions made by health and government authorities and
40
41 the evolution of the virus.
42
43

44
45 Regarding the management of COVID-19, national governments have taken
46
47 measures to counter the level of contagion, with 12 of the 18 countries analysed taking
48
49 strict quarantine measures for citizens, making changes according to the evolution of the
50
51 virus (with phases). The remaining countries adopted other measures without restricting
52
53 the mobility of citizens during the health emergency (without phases). However, these
54
55 decisions also affected citizen engagement, identifying those countries with phases with
56
57
58
59
60

1
2
3
4 an engagement score of 5.13, which is lower than the overall engagement. In contrast,
5
6 the engagement of the group of countries without phases increased and stood at 8.93.
7

8
9 The main reason for the variation is related to the audience (measured by the
10 number of followers), which differs significantly in the analysed groups: the group with
11 phases has, on average, 170,744.23 followers, and the group without phases has
12
13 16,735.21 followers, on average, which has a negative relationship to engagement, i.e.,
14
15 the lower the number of followers of an account the higher the engagement (Bonsón et
16
17 al. 2019). On the other hand, the uncertainty of the number of infections and the greater
18
19 flexibility in the mobility measures explain the higher engagement in countries without
20
21 phases, which use social media as the primary communication channel to learn about
22
23 the decisions made by local governments. Whereas in the countries with phases, the
24
25 decisions related to COVID-19 were more extensive, which reduced the uncertainty so
26
27 that citizens at home could use other media to review the health situation (T.V., radio,
28
29 newspapers).
30
31
32
33

34
35 These results allow us to identify citizens who started interacting more with
36 local government accounts during the identified phases; in Phase 0, when there was low
37 information about and attention paid to the virus, engagement was 3.39. Subsequently,
38
39 this increased in Phase 1 to 3.68, confirming the first case in each country analysed.
40
41
42

43
44 In Phase 2, when the authorities extended the period of confinement and adopted
45 other measures, the citizen engagement was 6.81. This result shows the incidence of the
46 quarantine decisions taken by the governments and how it was going to affect citizens
47
48 who began to resort to real-time information on Twitter and to interact more with other
49
50 users, as uncertainty about the changes and the implications in economic matters and
51
52 social aid, generated greater engagement with citizens. Furthermore, according to
53
54 Stieglitz et al. (2022), the use of social media increases particularly in the early stages of
55
56
57
58
59
60

1
2
3
4 crises due to the uncertainty and ambiguity of the event. In contrast, with Phase 3, the
5
6 gradual opening of the economy and lifting of many restricted activities reduced
7
8 engagement to 5.52. These results show that expectations of government decisions and
9
10 the evolution of the health emergency influenced how citizens interact with
11
12 governments via Twitter. Thus, this social media is a communication channel with
13
14 variations in citizen authorities' relations'.

17
18 In the second part of the study, we analyse the relationship between engagement
19
20 and communication interaction (transparency, collaboration, and Interaction) to identify
21
22 governments' role and objective in using social media during health emergencies.

23
24 According to the results in Table 8, local governments in Latin America are moving
25
26 towards improving interaction with citizens and establishing two-way communication,
27
28 highlighting 68.17% (with phases) and 56.05% (without phases) of participation
29
30 through likes, comments, and responses to messages, establishing a closer relationship
31
32 between citizens and generating a bidirectional flow (Chen et al. 2020). The systematic
33
34 use of social media, with the issuance of emergency messages and warnings, allows for
35
36 a high level of engagement, interaction, and collaboration (Lindsay 2011).

37
38
39
40 Some progress in interaction also evidences the commitment of local
41
42 governments to improve a two-way relationship on Twitter by identifying that 10.98%
43
44 and 12.16% of messages had a direct response from local governments with phases and
45
46 without phases, respectively, representing higher levels of engagement (Agostino and
47
48 Arnaboldi 2016). These results differ from studies conducted in other regions that have
49
50 concluded that the main objective of public entities in social media is a one-way
51
52 communication focused on transparency (Mergel 2013; Zavattaro et al. 2015) with low
53
54
55
56
57
58
59
60

1
2
3
4 engagement, with 31.79% and 20.85% of the interactions that governments have had
5
6 with phases and without phases, respectively.
7
8

9
10 The evolution of local government communications during the phases adopted
11 for the management of COVID-19 is similar to general analysis (Table 9). The results
12 highlight the commitment of local governments to establish participation and
13 collaboration with citizens in the different stages of the pandemic, showing a positive
14 trend in the increase in participation and collaboration. The results are related to the
15 need to explain the different measures adopted by the local government after the
16 confinement, which generated concerns among citizens and increased the response
17 capacity. This tendency establishes dialogical communication as governments interact
18 with citizens and other stakeholders through a bidirectional conversation (Chen et al.
19 2020; Mori et al. 2020). Participation slightly decreased from Phase 2 to Phase 3
20 (72.25% to 67.34%) due to the authorities' decisions to open the economy and the
21 gradual return to normal activities, which reduced citizens' uncertainty about managing
22 the pandemic. Therefore, the behaviour of the virus and the management of local
23 authorities did impact the levels of engagement and interaction on Twitter and the
24 commitment of local governments in Latin America to take advantage of the benefits of
25 social media to strengthen their relationship with citizens during the first wave of the
26 pandemic.
27
28
29
30
31
32
33
34
35
36
37
38
39
40
41
42
43
44

45
46 In brief, there is an evolution towards more interactive and bidirectional
47 communication, with increased participation and collaboration between local
48 governments and citizens through Twitter during the different phases of pandemic
49 management. The results allow different characteristics of the engagement in local
50 government in Latin America to be identified, especially in pandemic times. First, the
51
52
53
54
55
56
57
58
59
60

1
2
3
4 results show that citizens communicate with the governments through social media
5
6 about health and socioeconomic difficulties that require the most attention from public
7
8 authorities to address their citizens' needs. Second, there was an increase in citizen
9
10 engagement and interaction during the phases of the COVID-19 health emergency due
11
12 to uncertainty regarding the pandemic evolution and the constant measures associated
13
14 with their management. Lastly, there was a compromise of the local government of
15
16 communication interaction with the citizens through Twitter, with more participation
17
18 and interaction, which highlights the use of the tools of Web 2.0.
19
20

21 22 CONCLUSIONS 23 24

25 In the region and period analysed, an evolution and a transition to the true
26
27 purpose of using social media governments can be observed. As the considerable rise in
28
29 high levels of engagement has shown, measures to halt the advance of the pandemic
30
31 have tightened. Therefore, this reflects a more significant communication interaction
32
33 between local governments and citizens by increasing participation and collaboration on
34
35 Twitter during the most challenging moments of the first wave of the pandemic. In this
36
37 way, municipalities achieved the purpose of social media and the highest levels of
38
39 interaction associated with Open Government.
40
41

42
43 This study highlights the differences in the use of social media in Latin America
44
45 compared to other regions that have been analysed previously and concludes that the
46
47 principal aim of social media is to transmit information in a unidirectional way to local
48
49 governments (Haro-de-Rosario et al. 2018; Stone and Can 2020; Zavattaro et al. 2015)
50
51 with a lower level of engagement (Agostino and Arnaboldi 2016). Additionally, this
52
53 research provides evidence of the advances of local government in crisis management
54
55 through the use of social media for interaction with citizens and generating a two-way
56
57
58
59
60

1
2
3
4 relationship, creating spaces for participation and collaboration in an unprecedented
5
6 health crisis.
7
8

9 **Theoretical and Practical Implications**

10
11
12 This study makes several theoretical contributions. It adds new evidence to the
13 literature on governmental use of social media to promote citizen engagement (Criado,
14 Sandoval-Almazan, and Gil-Garcia 2013), a topic of increasing interest but limited
15 studies, especially in crisis and developing countries (Zavattaro et al. 2015). It also
16 analyses the evolution of citizen engagement during different emergency phases,
17 highlighting changes in citizens' communication behaviours with the government.
18
19
20
21
22
23
24
25

26 Additionally, this study reveals the progress of Latin American municipalities in
27 using social media for two-way communication, contrasting previous findings that
28 suggested low interactive participation (Haro-de-Rosario et al. 2018). This research
29 diverges from the traditional one-way approach where public agencies primarily use
30 social media for information dissemination and transparency (Mergel 2013; Zavattaro et
31 al. 2015). It also showcases how local governments leverage social media during
32 serious risk situations. Another significant theoretical implication is the potential
33 inclusion in the prestigious Disaster Information Reference Library (DIRL), an ongoing
34 project by Professor Scholl (2023) at the University of Washington, which would
35 enhance knowledge dissemination and foster academic collaboration.
36
37
38
39
40
41
42
43
44
45
46
47

48 This study's practical implications are especially relevant for local governments
49 during the COVID-19 crisis. It emphasizes the importance of understanding crisis
50 management through social media across various scenarios. Latin American
51 municipalities effectively used Twitter during the pandemic's first wave, demonstrating
52
53
54
55
56
57
58
59
60

1
2
3
4 the need for continued engagement to foster two-way communication beyond the health
5
6 crisis. Municipalities should monitor citizen publications on social media to identify
7
8 concerns and enhance responsiveness (Liao et al. 2020). Valuing all interactions,
9
10 including likes and responses, is crucial, particularly in health risk communication
11
12 (Ngai et al. 2020). This research encourages local governments to view social media as
13
14 an information tool and a vital communication platform in health crises.
15

16 17 18 **Limitations and Future Research** 19

20
21 This study has several limitations that need to be discussed in future research.
22
23 Firstly, the analysis focused only on Twitter interaction metrics (likes, retweets, and
24
25 responses) and did not consider tweet content. Future studies should include a content
26
27 analysis to understand the topics driving engagement during different pandemic phases.
28
29 Additionally, examining how local governments use Twitter to promote accountability,
30
31 communicate public policies, and respond to citizens is essential; it could reveal the
32
33 impact of social media on transparency, accountability, and public trust in local
34
35 authorities.
36

37
38 Another limitation is the collective analysis of all Latin American countries without
39
40 considering their unique sociocultural aspects. Future studies should incorporate
41
42 Hofstede's cultural dimensions for a more individualized country analysis (Hofstede
43
44 2001), recognizing the cultural differences within Latin America (Hidalgo Campos et al.
45
46 2007).
47

48
49 Generalizing these results to other regions is problematic, as the study did not consider
50
51 whether engagement spikes were due to regional events or the pandemic. Future
52
53 research should compare countries similarly affected by the pandemic to determine
54
55 broader applicability.
56
