

## LIBRO DE COMUNICACIONES

*17ª REUNION CIENTÍFICA PLENARIA DE QUÍMICA INORGÁNICA*  
*11ª REUNIÓN CIENTÍFICA PLENARIA DE QUÍMICA DEL ESTADO SÓLIDO*

*Torremolinos (Málaga) 19 - 22 Junio 2016*

Reunión Científica y Plenaria de Química Inorgánica y Estado Sólido  
Torremolinos (Málaga), 2016

Libro Resumen de Comunicaciones (Abstracts) / QIES16,  
17ª Reunión Científica Plenaria De Química Inorgánica y  
11ª Reunión Científica Plenaria De Química Del Estado Sólido de la RSEQ,  
en Torremolinos (Málaga) del 19 al 22 de junio de 2016.

**EDITA**

Enrique Rodríguez Castellón, Universidad de Málaga  
Mercedes Moreno Recio, Universidad de Málaga

Ordinary Portland cement (OPC) is an environmentally contentious material, as for every ton of OPC produced, on average, 0.97 tons of CO<sub>2</sub> are released. Ye'elimite-rich cements are considered as eco-cements because their manufacturing process releases less CO<sub>2</sub> into the atmosphere than OPC; this is due to the low calcite demand. Belite-Alite-Ye'elimite (BAY) cements are promising eco-friendly building materials as OPC substitutes at a large scale. The reaction of alite and ye'elimite with water should develop cements with high mechanical strengths at early ages, while belite will contribute to later curing times. However, they develop lower mechanical strengths at early-medium ages than OPC. It is known that the presence of different polymorphs of ye'elimite and belite affects the hydration due to the different reactivity of those phases. Thus, a solution to this problem may be well the activation of BAY clinkers by preparing them with  $\alpha'_H$ -belite and pseudo-cubic-ye'elimite, jointly with alite.

The aim of this work is the preparation and characterization of active-BAY clinkers which contain high percentages of coexisting  $\alpha'_H$ -belite and pseudo-cubic-ye'elimite, jointly with alite to develop, in a future step, comparable mechanical strengths to OPC. The parameters evolved in the preparation of the clinker have been optimized, including the selection of raw materials (mineralizers and activators) and clinkering conditions. Finally, the clinker was characterized through laboratory X-ray powder diffraction, in combination with the Rietveld methodology, and scanning electron microscopy.
