## INTRODUCTION

Geminiviruses are plant viruses with circular, single-stranded DNA (ssDNA) genomes that replicate in nuclei of mature plant cells by using plant replisome and the viral protein Rep. This viral protein interacts with diverse plant proteins, including PCNA (Proliferating Cell Nuclear Antigen) (Castillo *et al.*, 2003) and SCE1 (SUMO conjugating enzyme) (Castillo *et al.*, 2004).

PCNA is a key factor for DNA replication, providing a platform that coordinates a wide range of processes involved in maintenance, duplication and transmission of the genome (fig. 1). Control of PCNA-interactions involves post-transcriptional modifications, such as ubiquitination and sumoilation. Sumoilation machinery includes a series of biochemical steps catalysed by a set of well conserved enzymes, comprising an activating enzyme E1, a conjugating enzyme E2 and a ligase E3 (fig. 2). SUMO can be covalently attached to lysine residues in a large number of proteins, regulating their target's interactions, localization and function. *Arabidopsis thaliana* has eight genes and one pseudogene. AtSUMO1, 2, 3, and 5 genes are expressed *in vivo*. Modification of PCNA by ubiquitin and SUMO are events that modulate the function of the protein (fig. 3).

Figure 1. PCNA functions.

Figure 2. The sumoilation cycle.

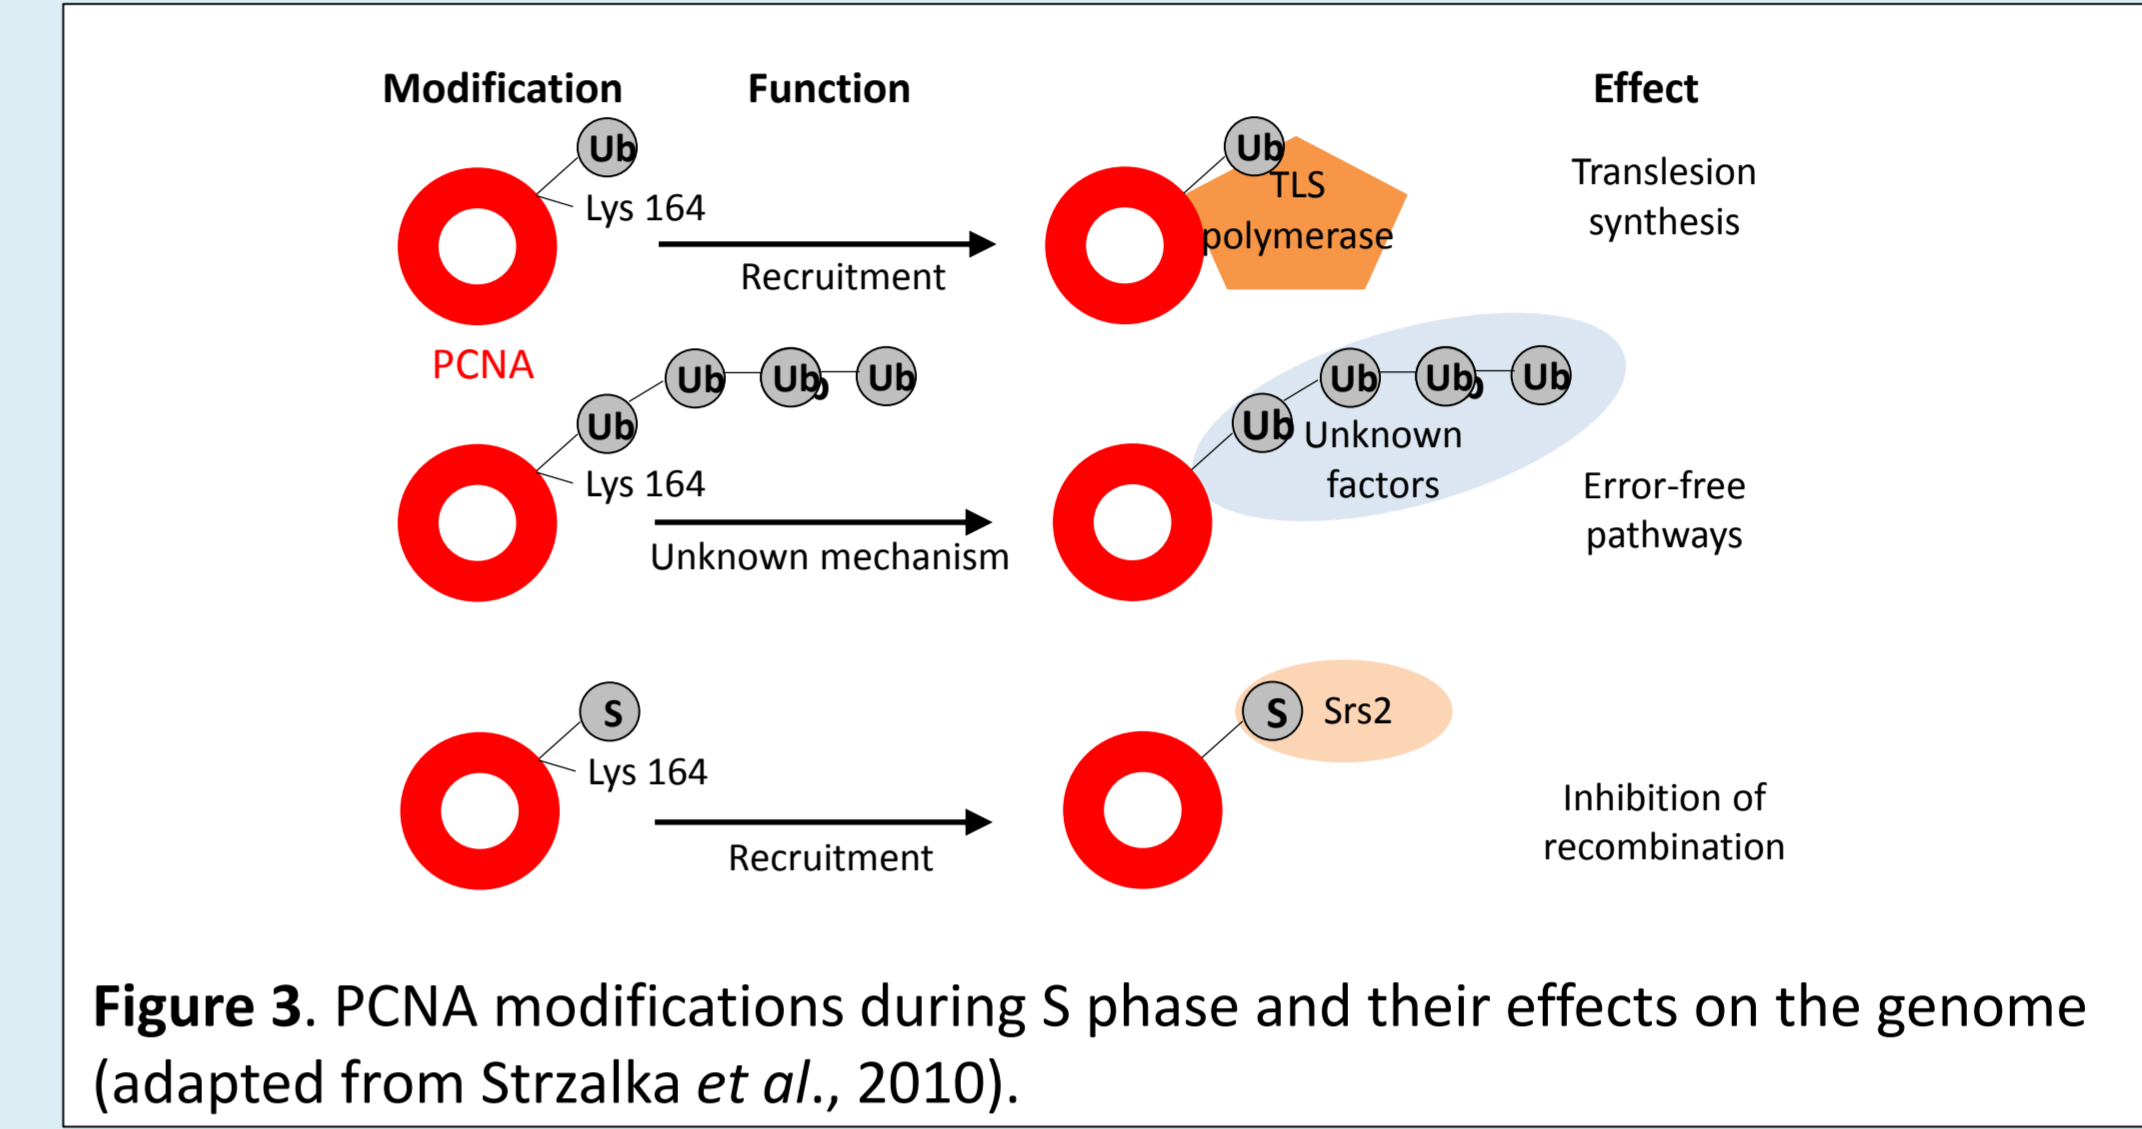

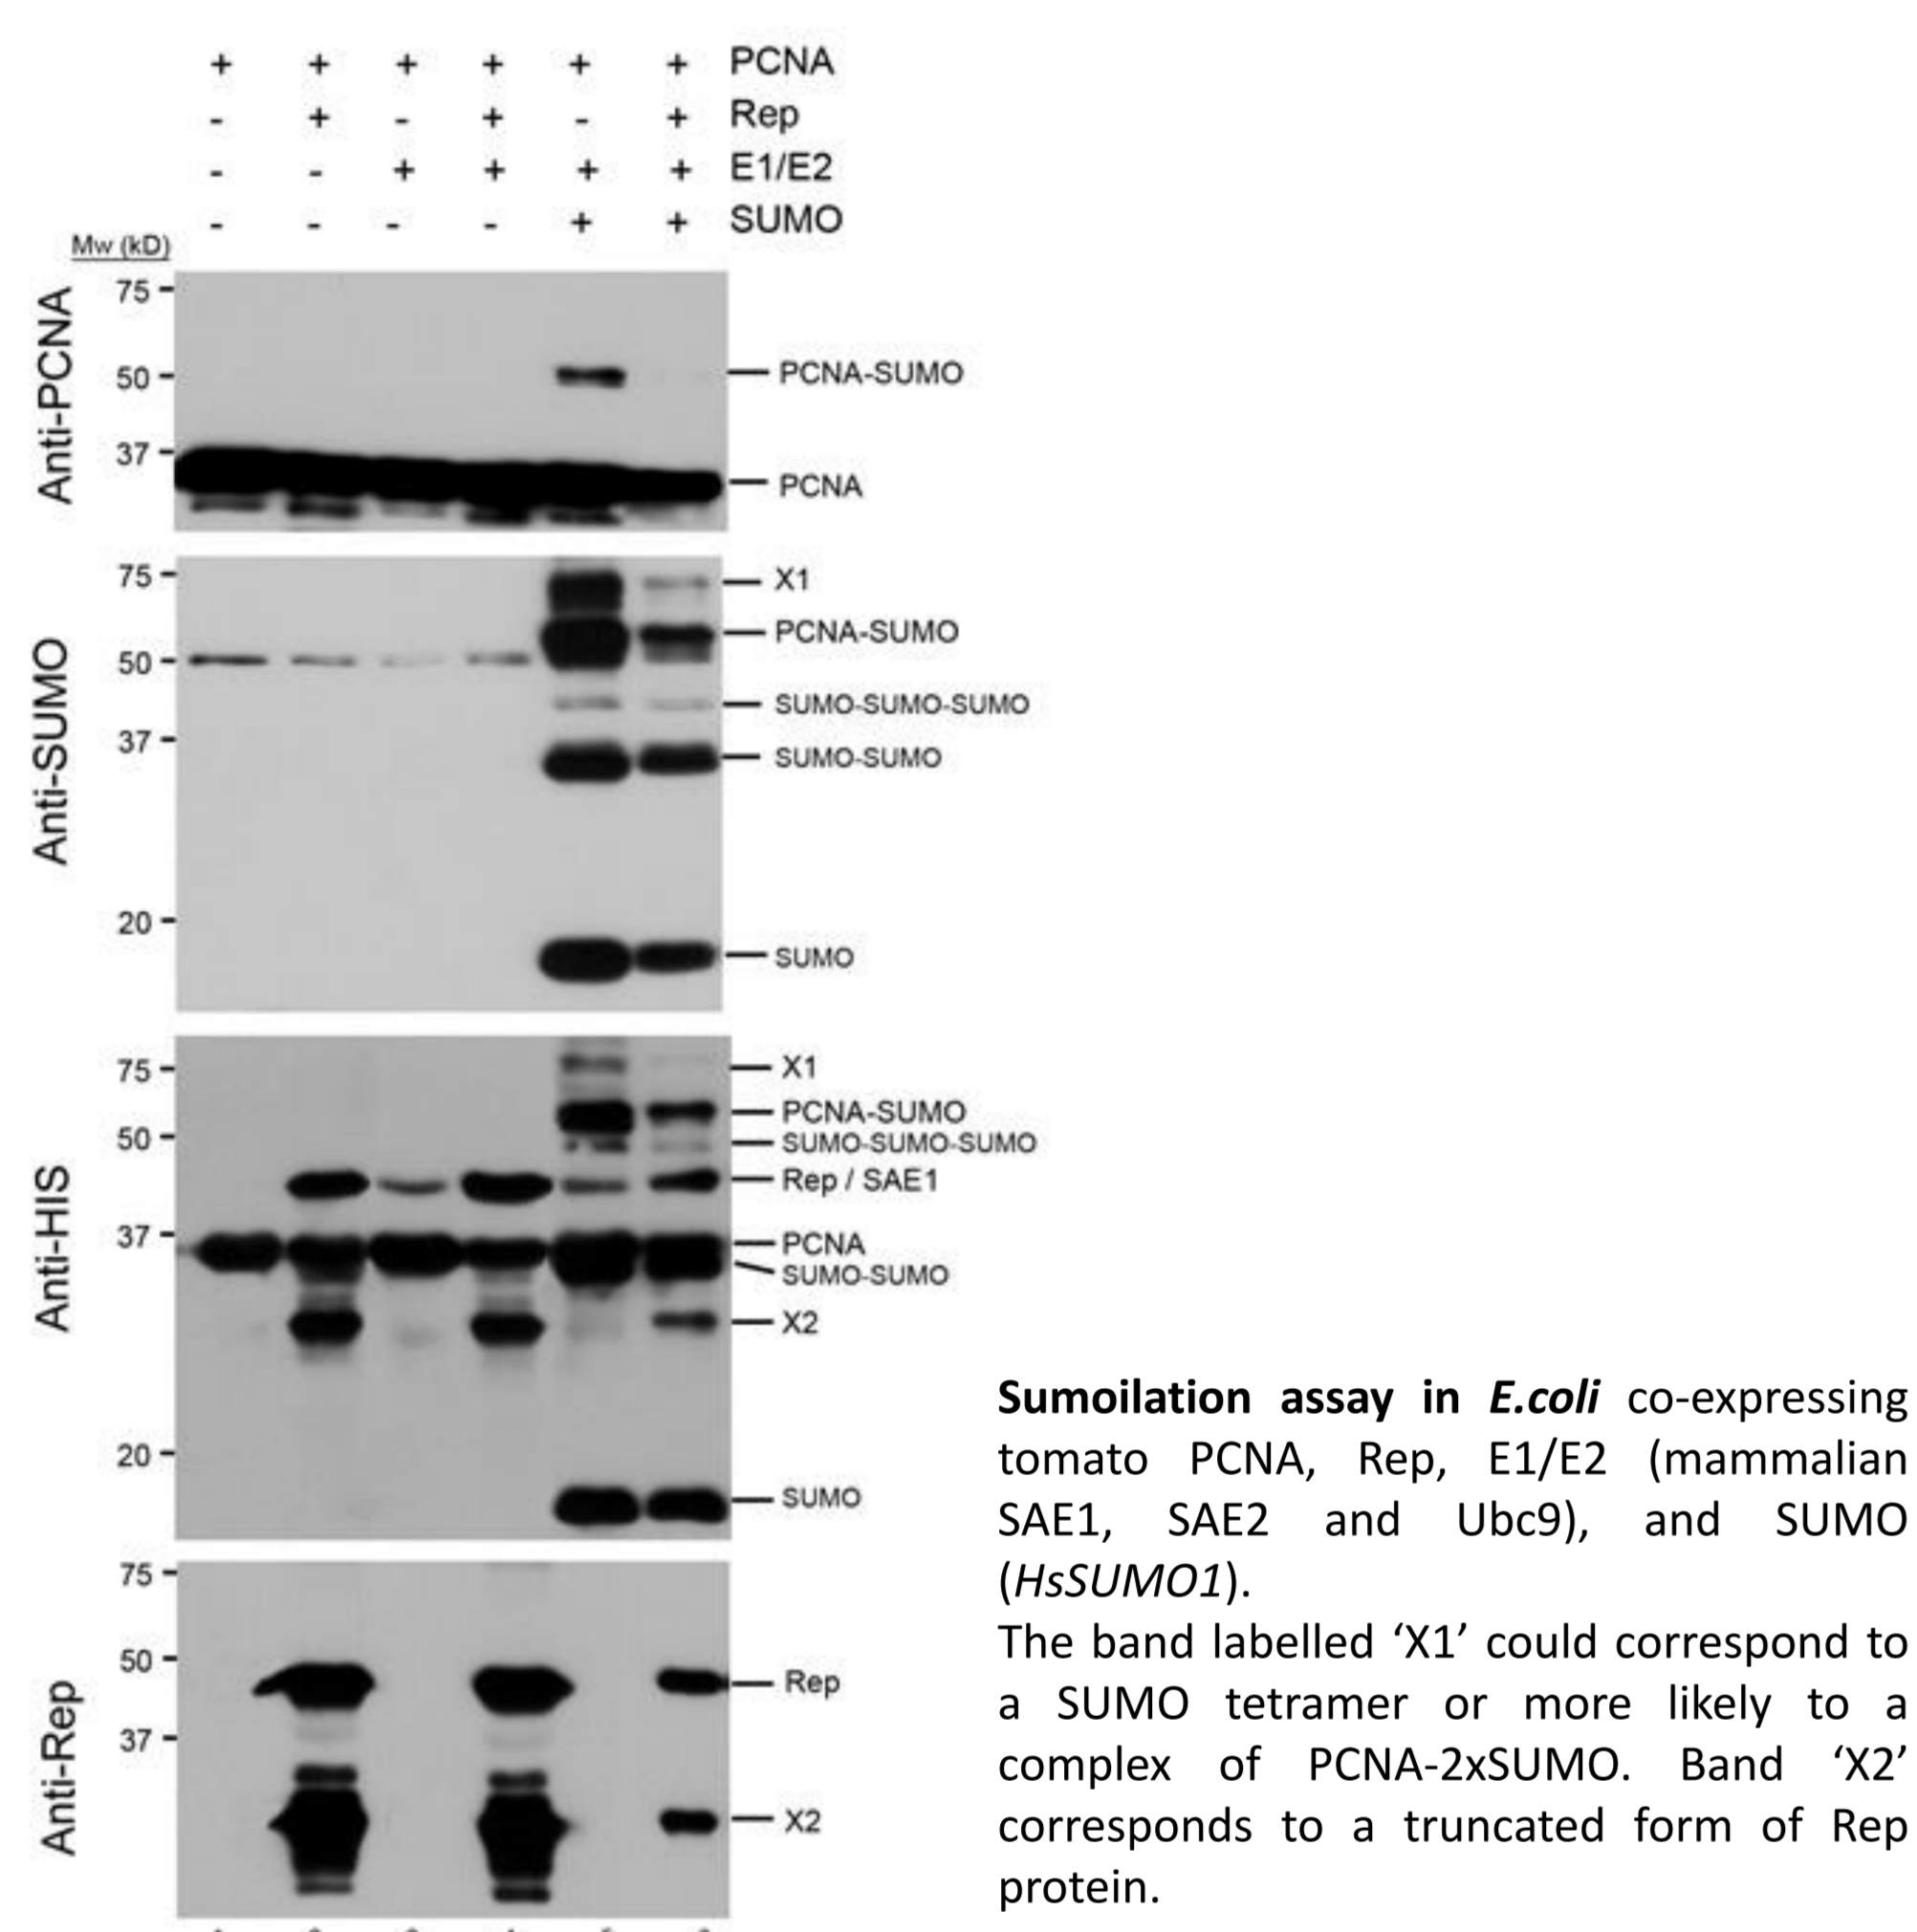

Figure 3. PCNA modifications during S phase and their effects on the genome (adapted from Strzalka *et al.*, 2010).

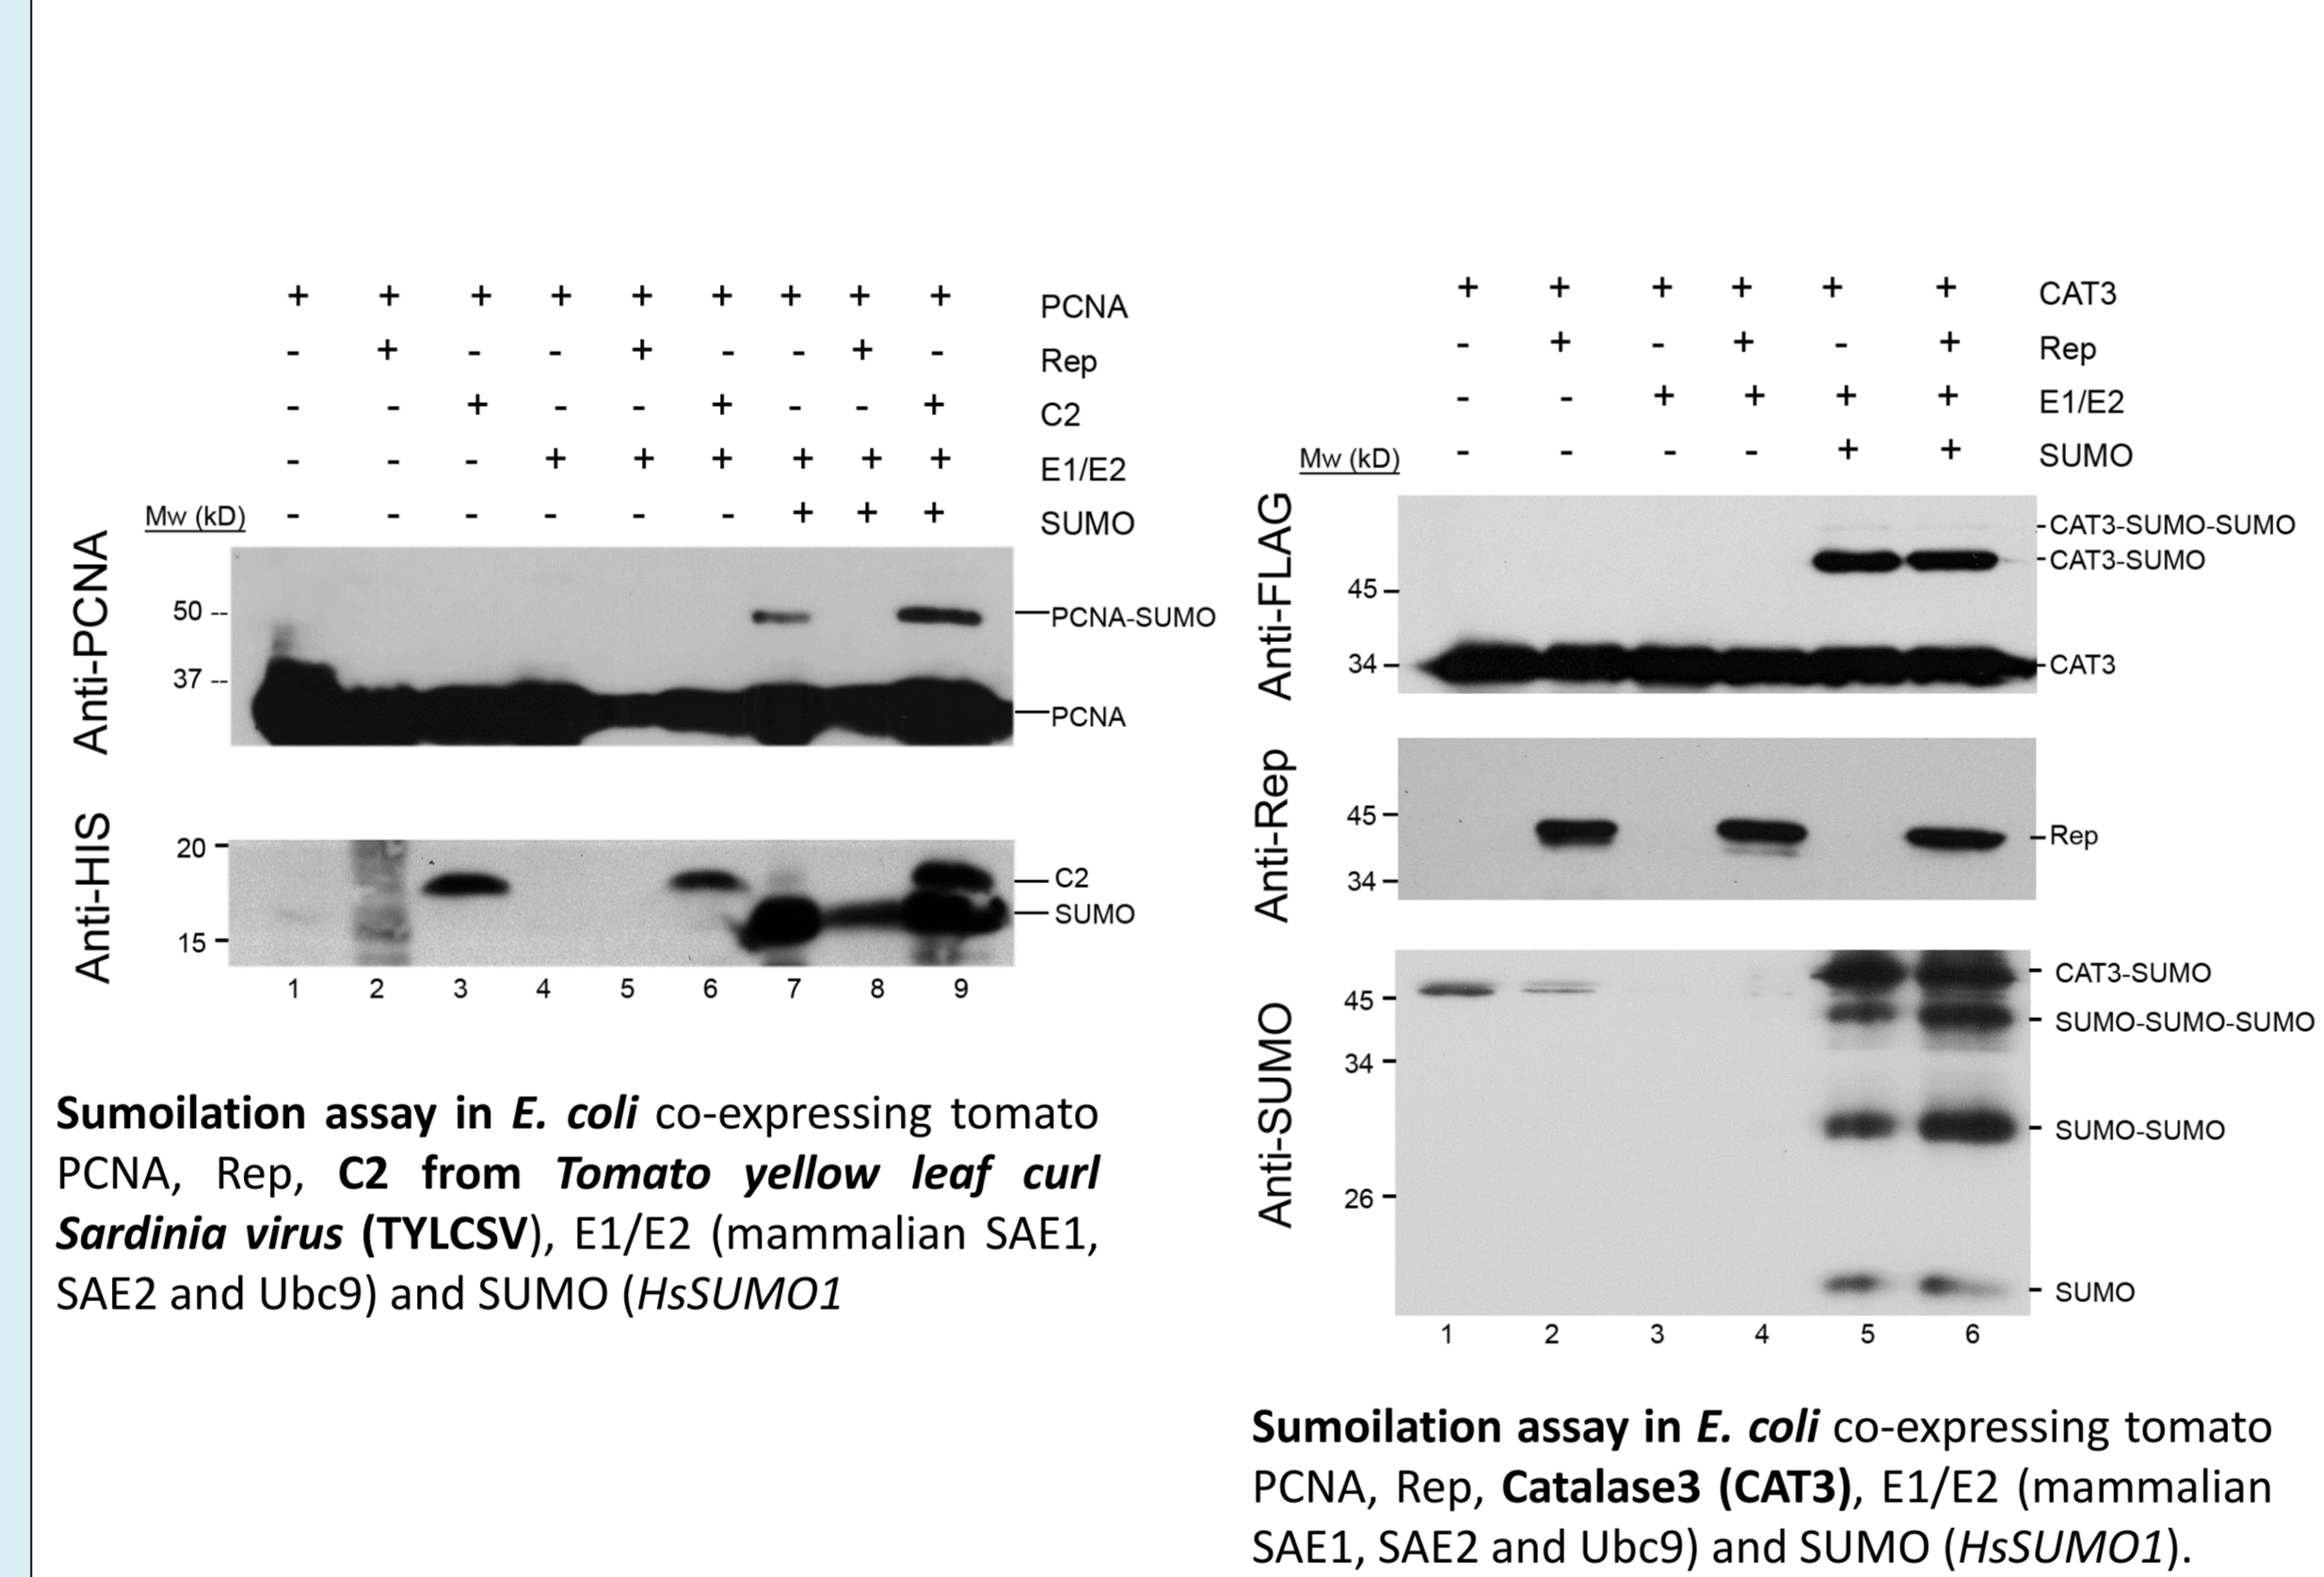

Previously, we reported that Rep ectopic expression does not result in broad changes in the sumoilation pattern of plant cells, but it modifies the sumoilation state of selected host proteins. In this work, we show, using a reconstituted sumoilation system in *Escherichia coli*, that tomato PCNA is sumoilated at two residues, K254 and K164, and that co-expression of the Rep protein suppresses PCNA sumoilation at these lysines. Finally, we confirm that PCNA is sumoilated and that Rep also interferes with PCNA sumoilation *in planta*.

## RESULTS

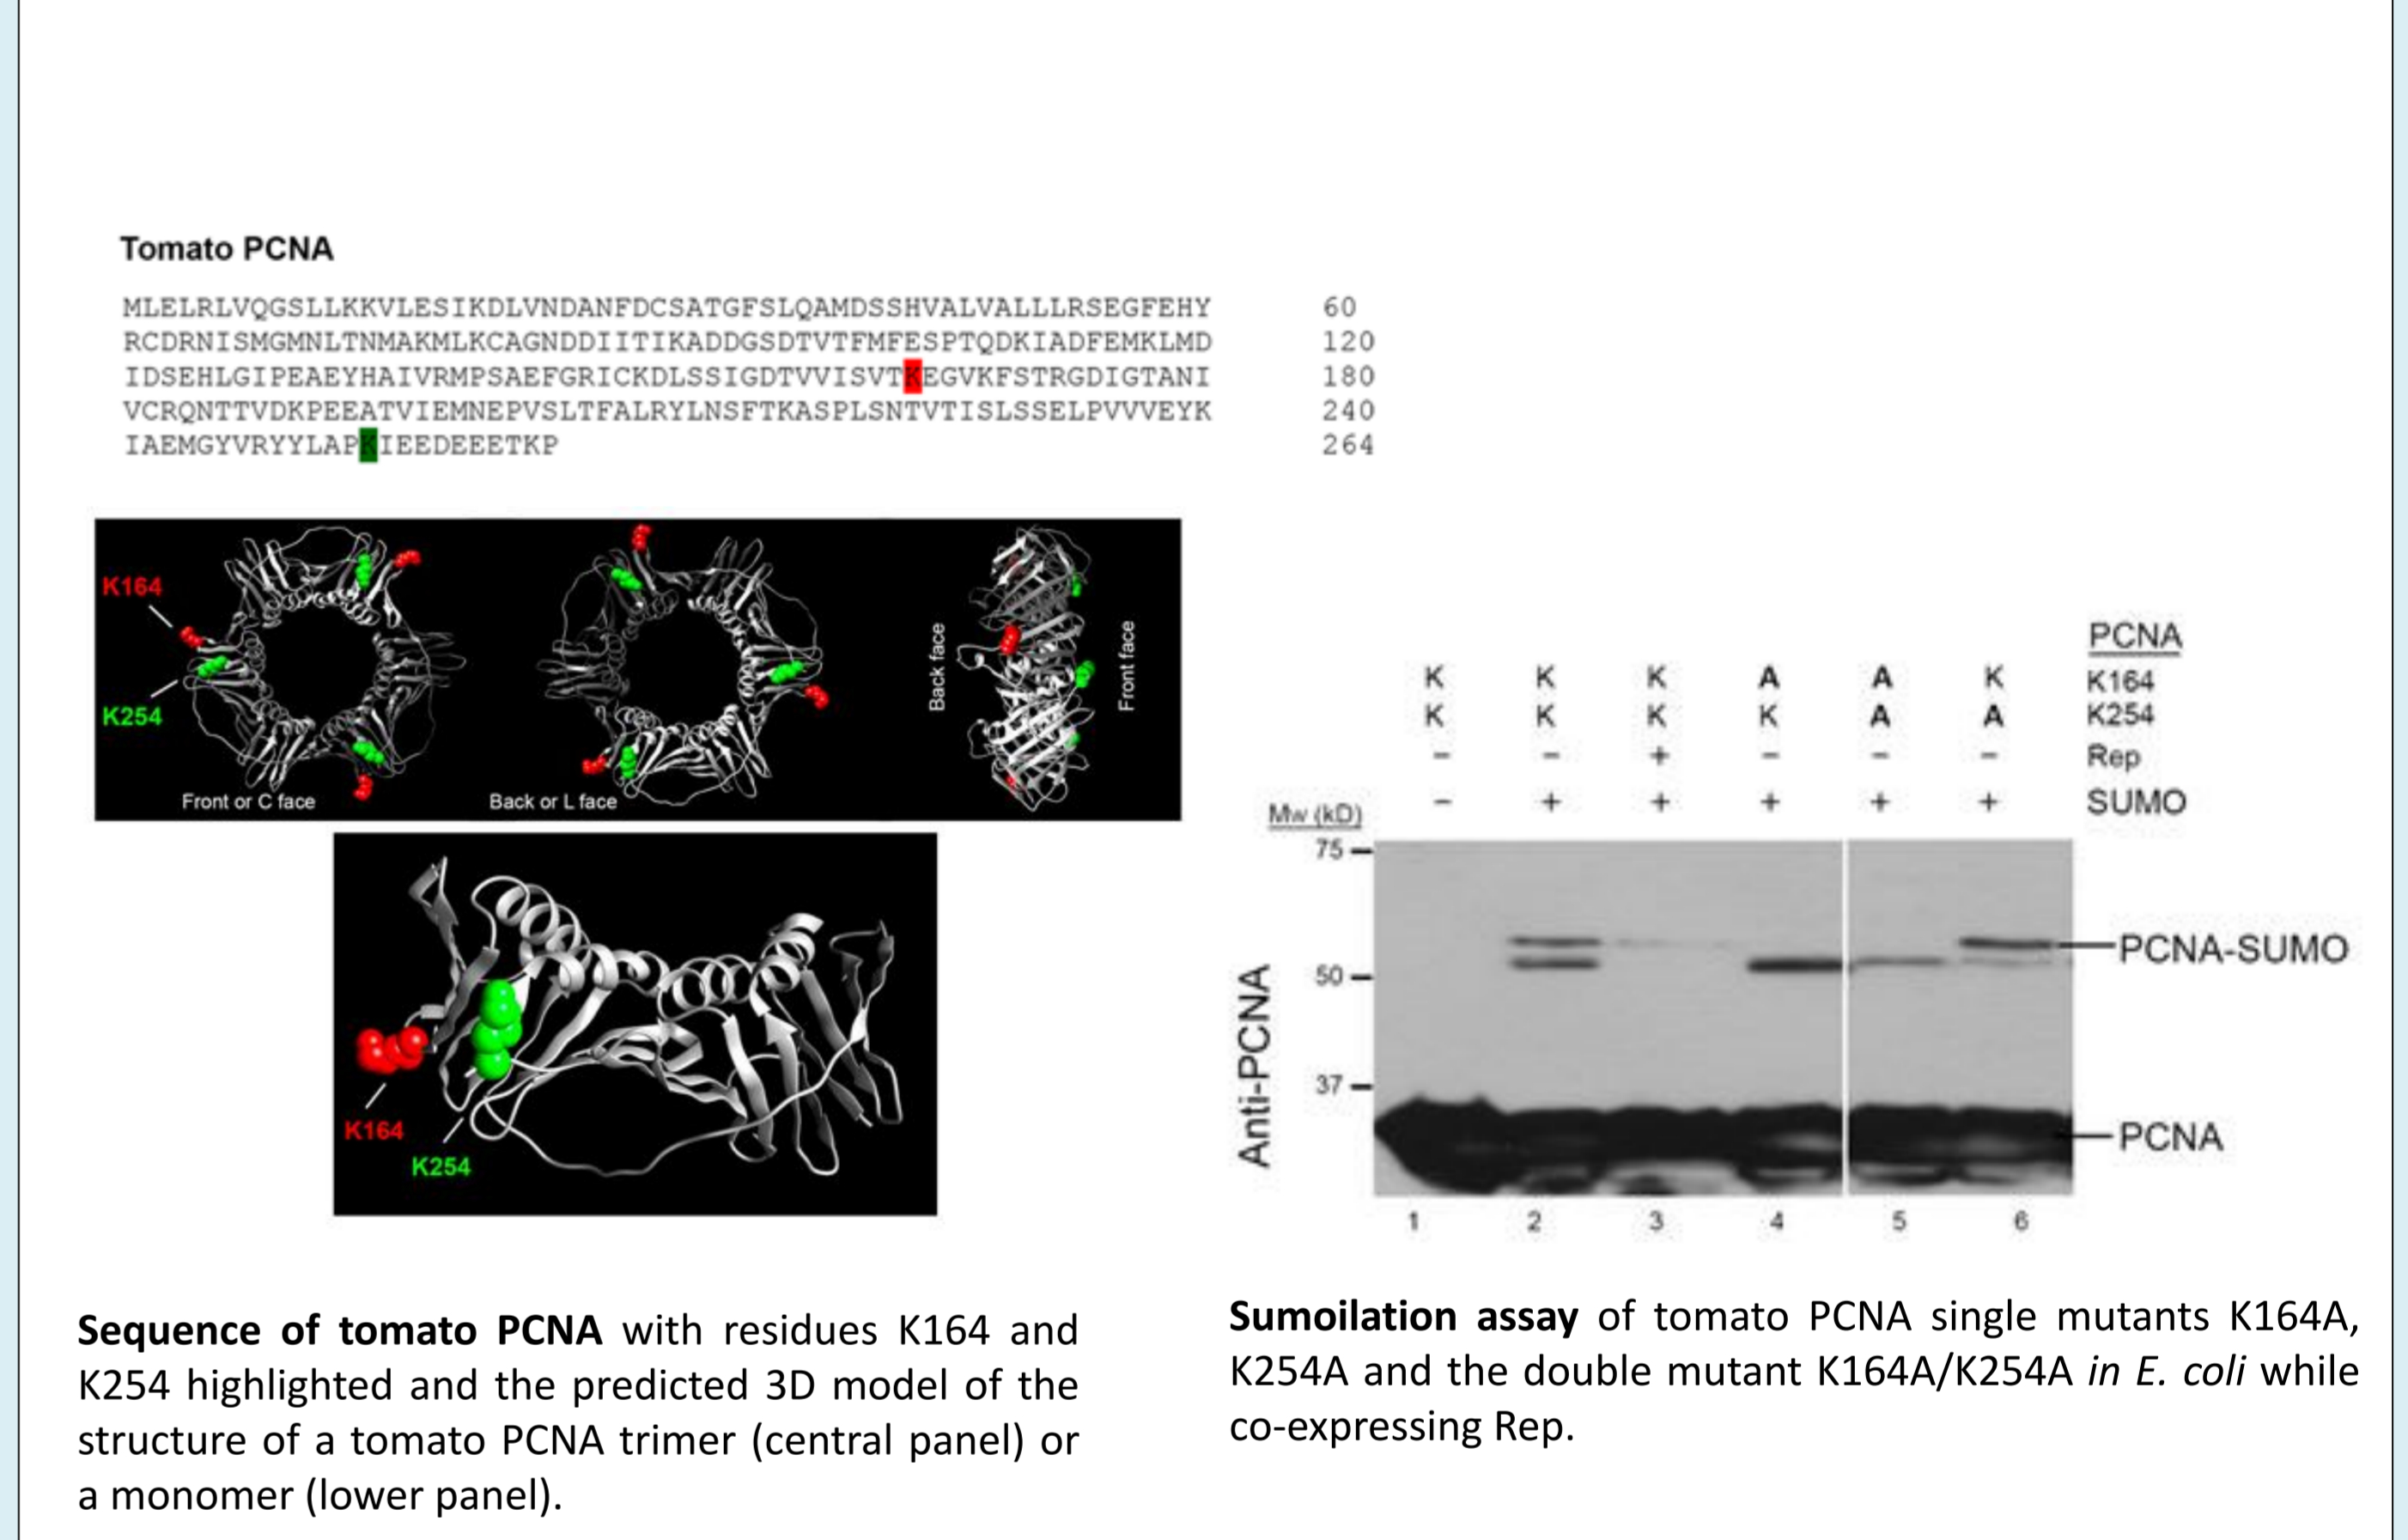

### Rep expression reduces PCNA sumoilation

### Rep, but not C2, interferes only with sumoilation of PCNA but not of other proteins

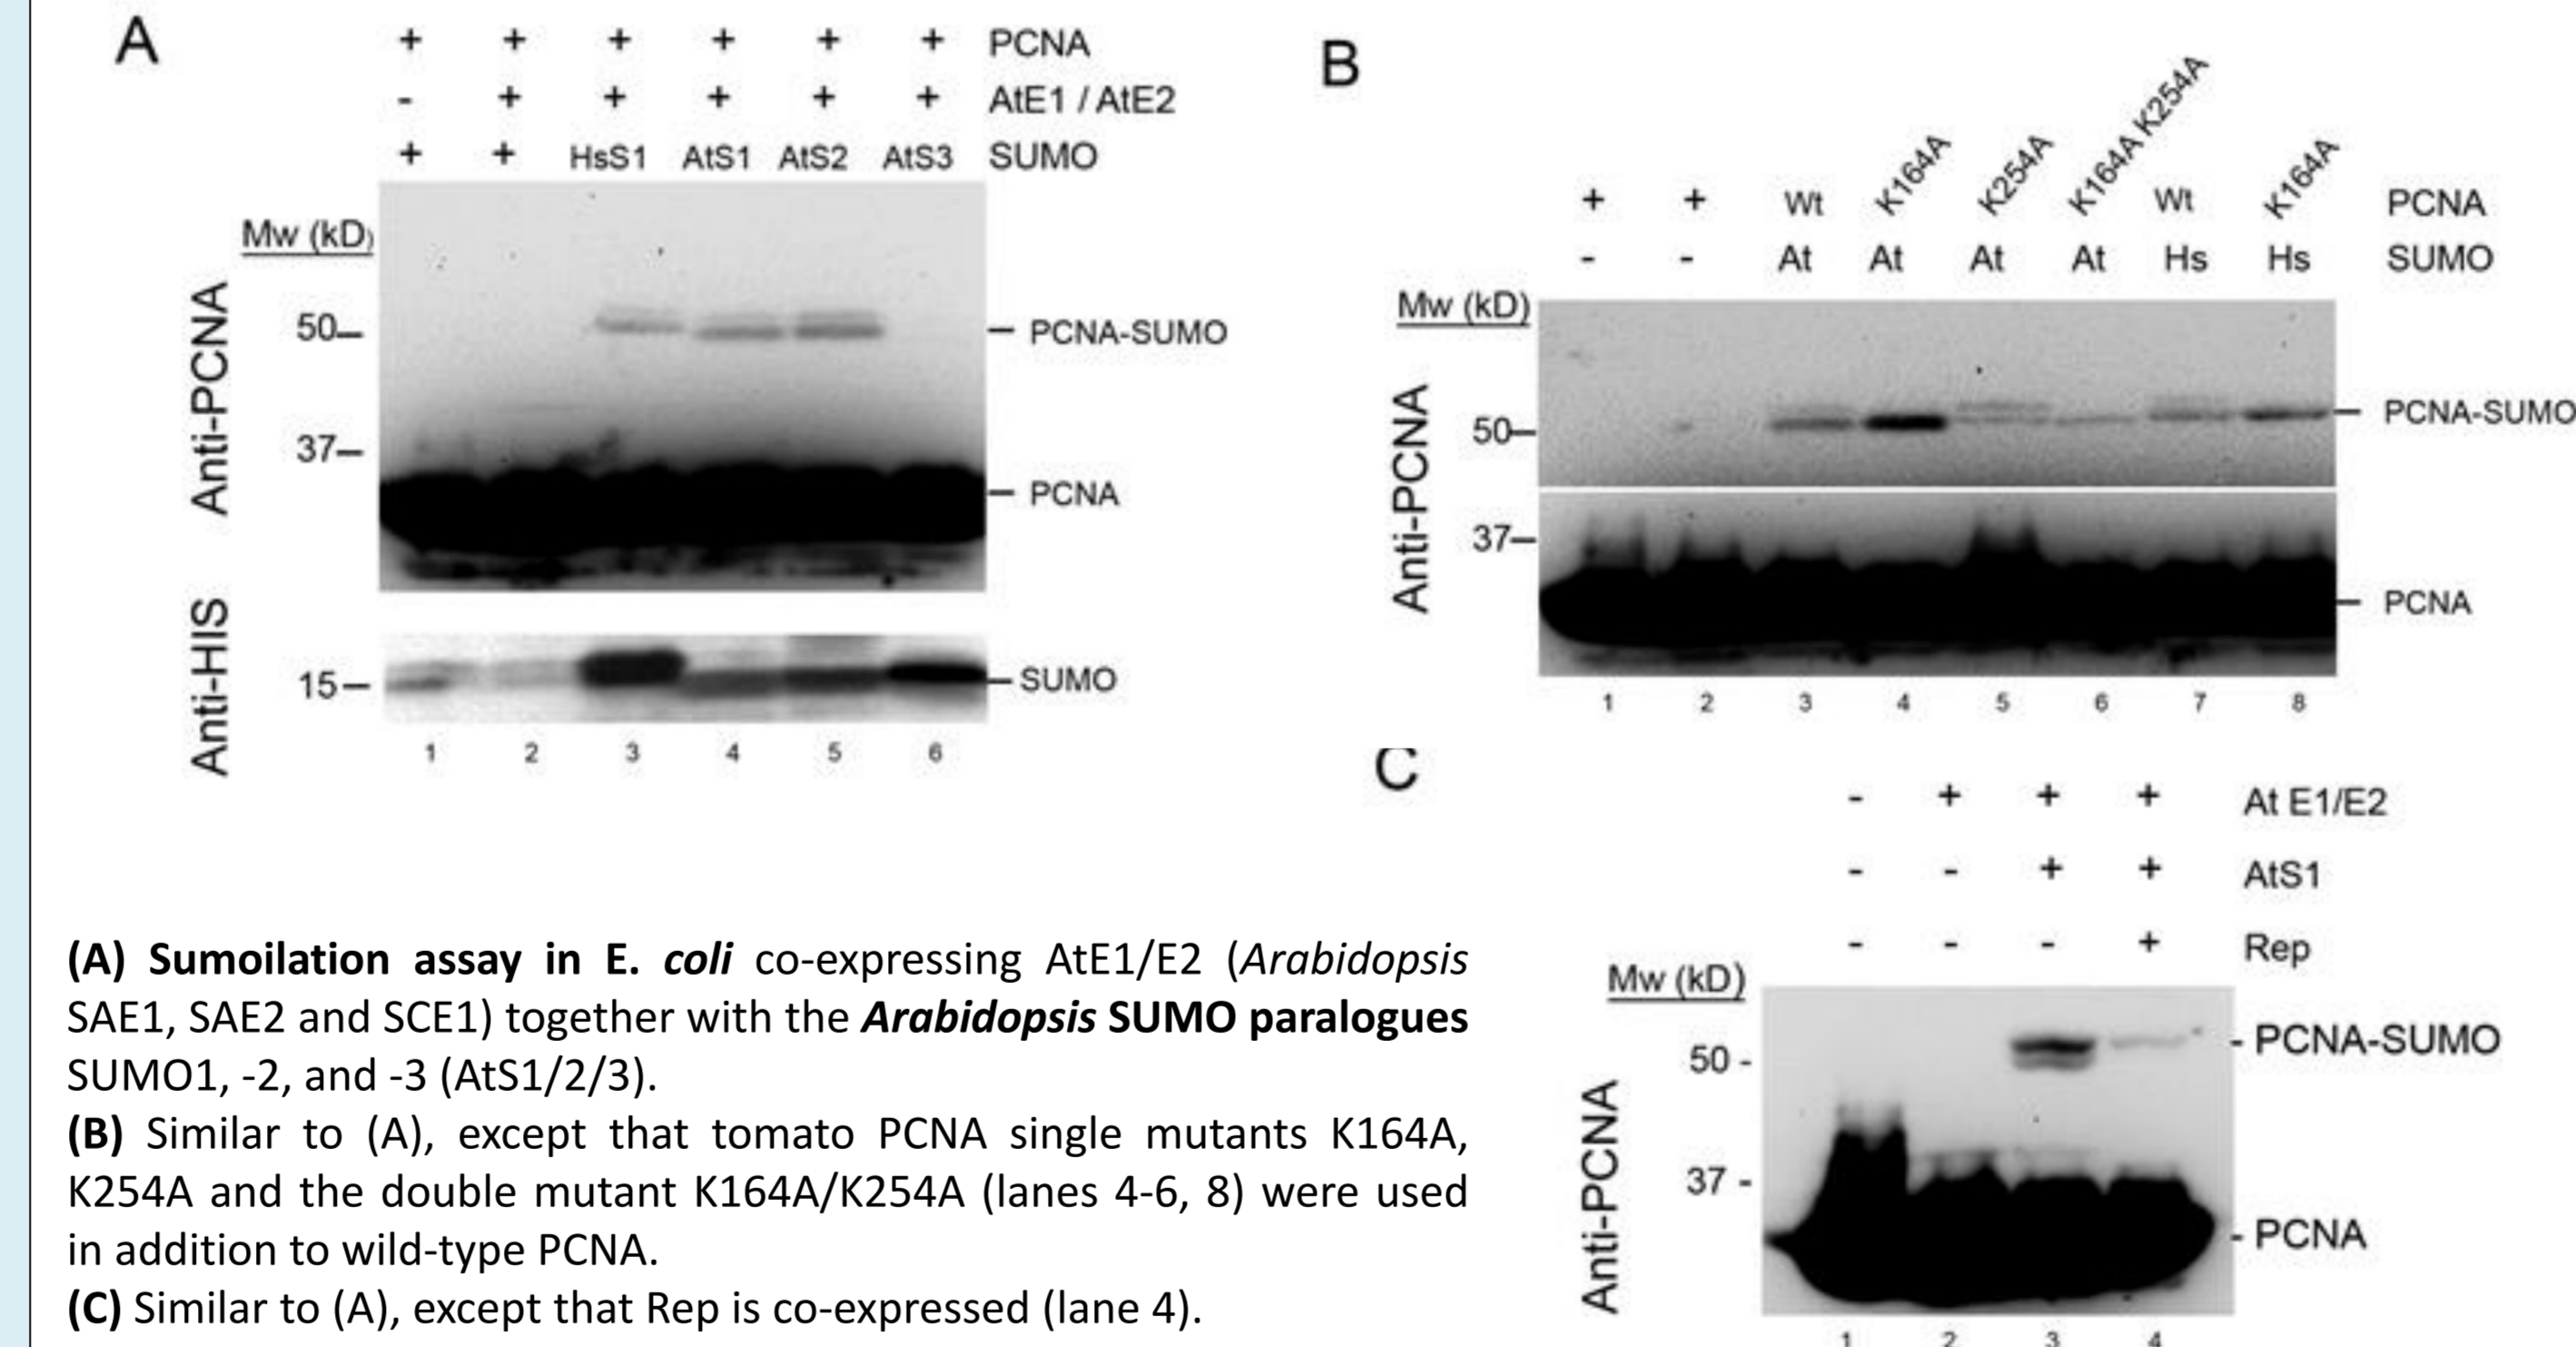

### K164 and K254 residues are sumoilated in tomato PCNA

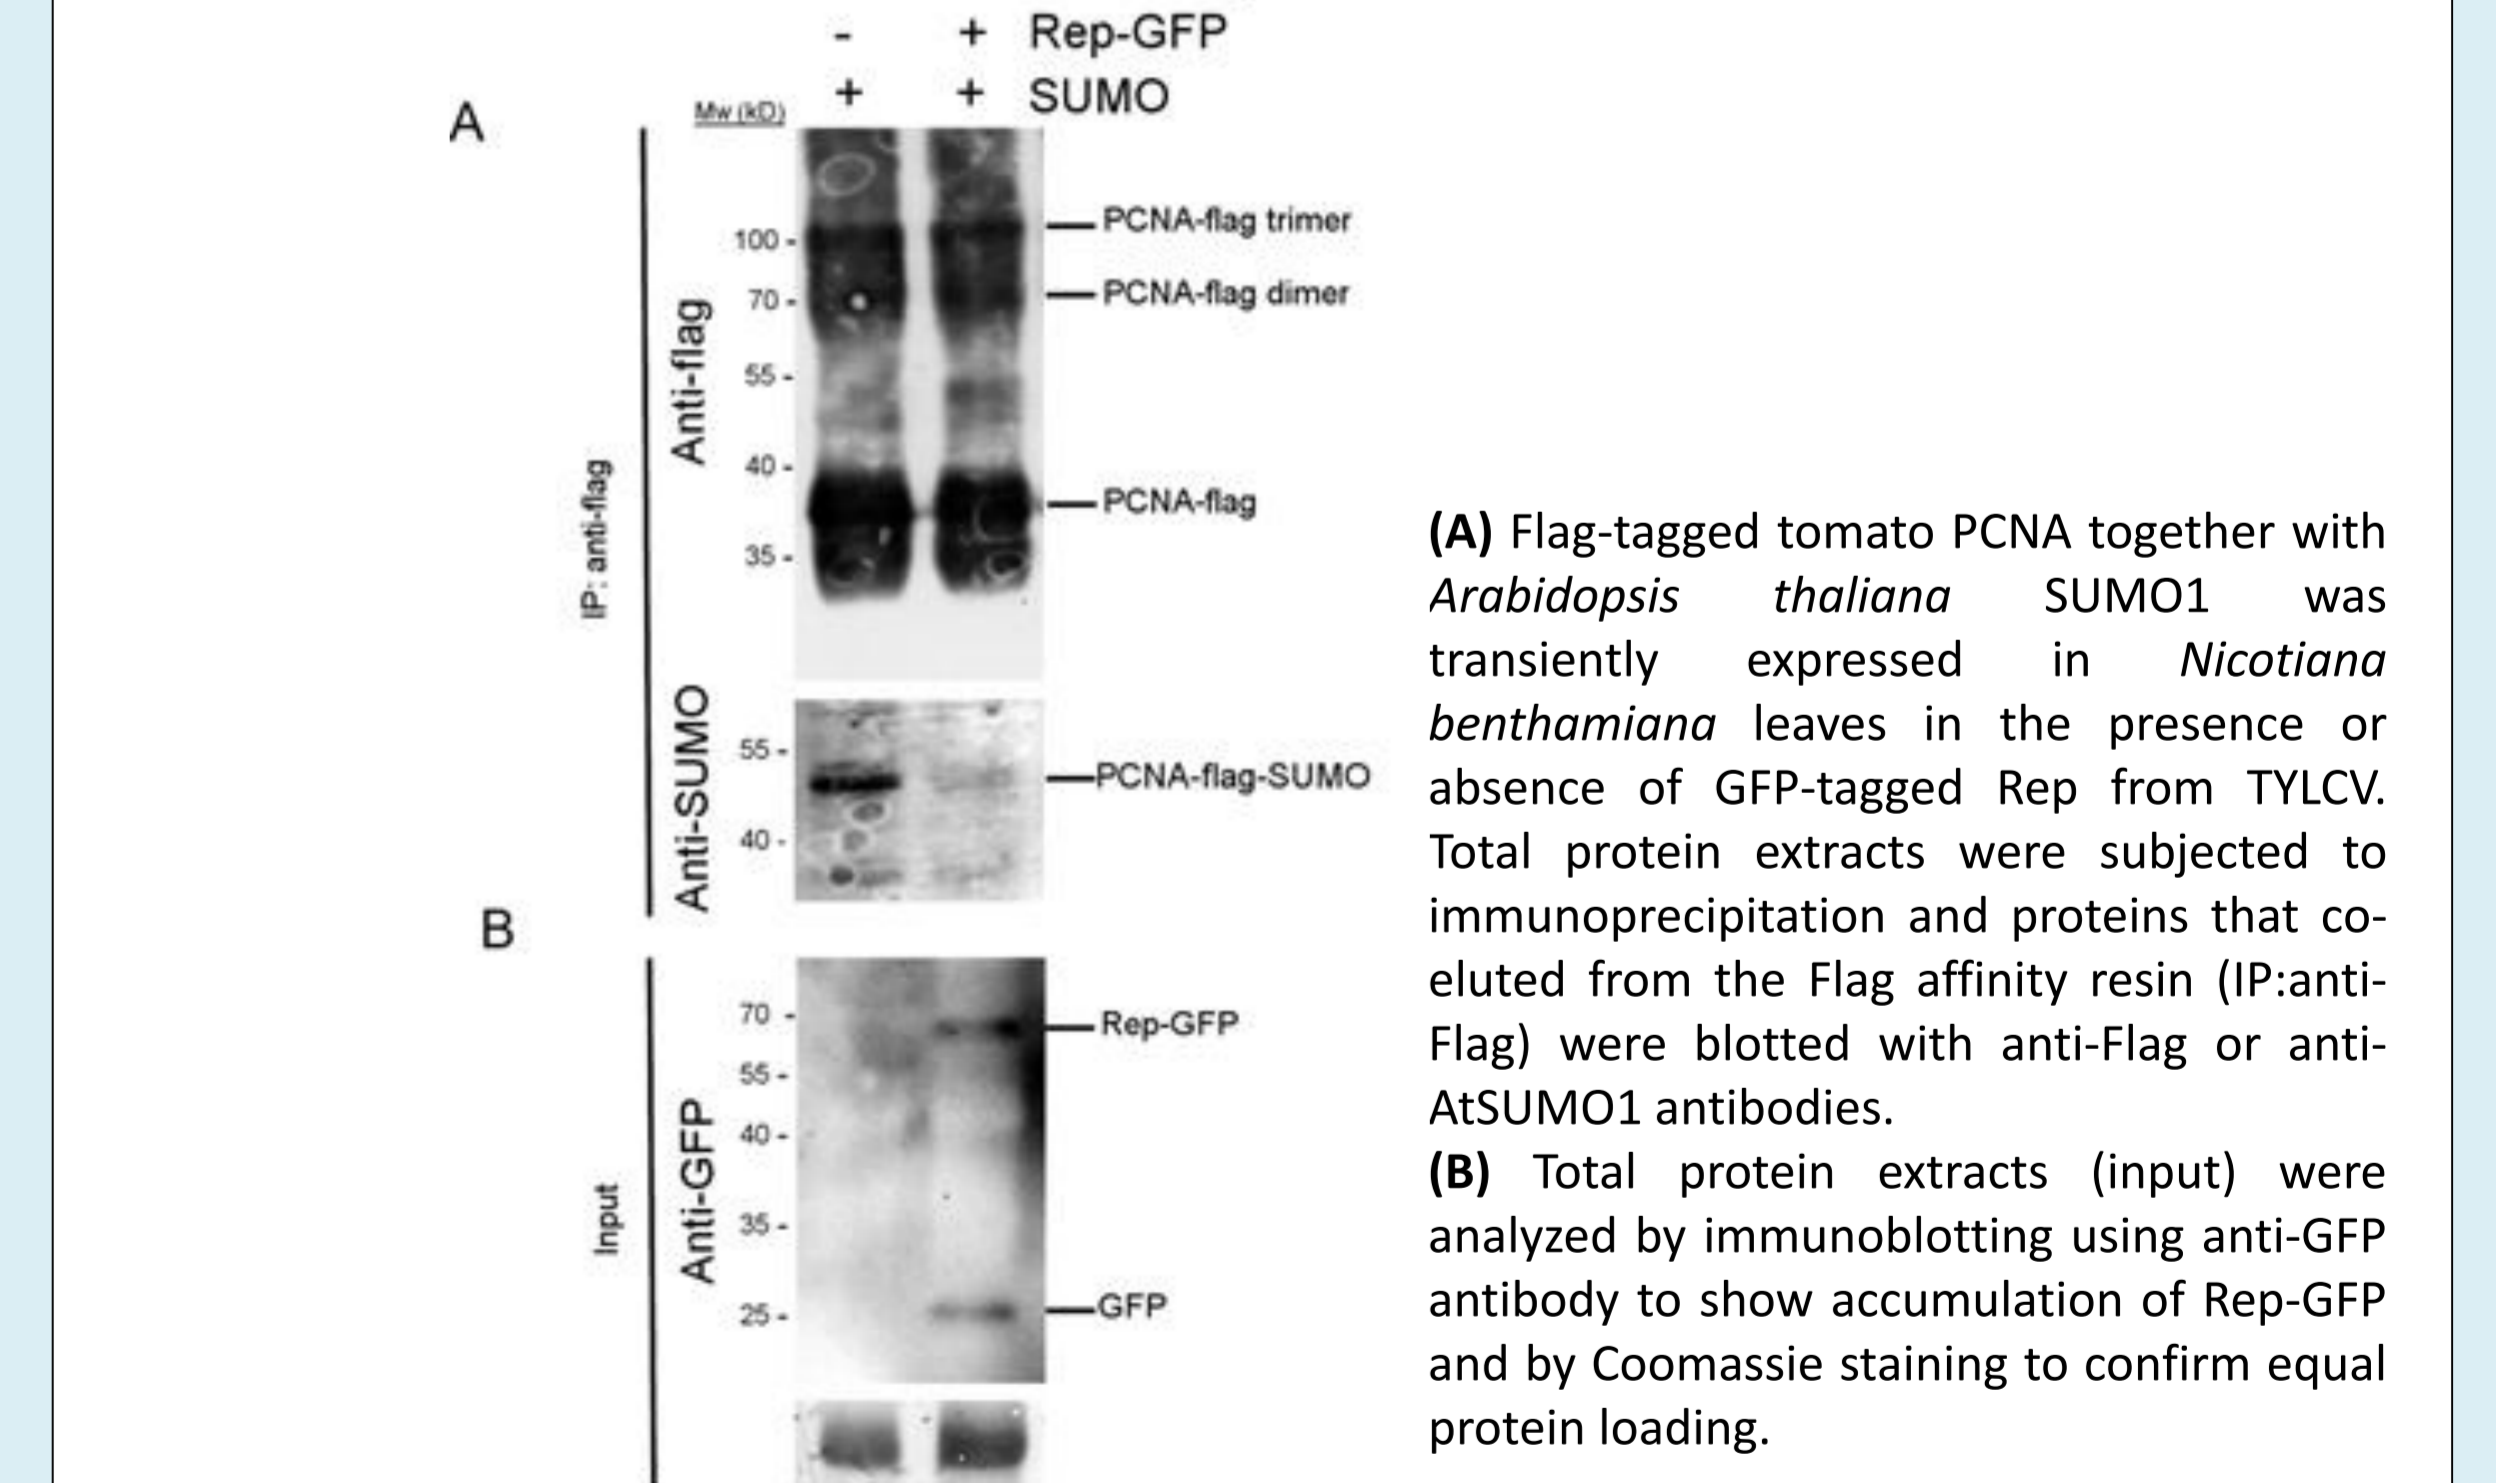

### The Rep-SCE1 interaction is not essential to suppress PCNA sumoilation in bacteria

### *Arabidopsis* SUMO conjugation enzymes modify the same lysine residues in tomato PCNA in bacteria

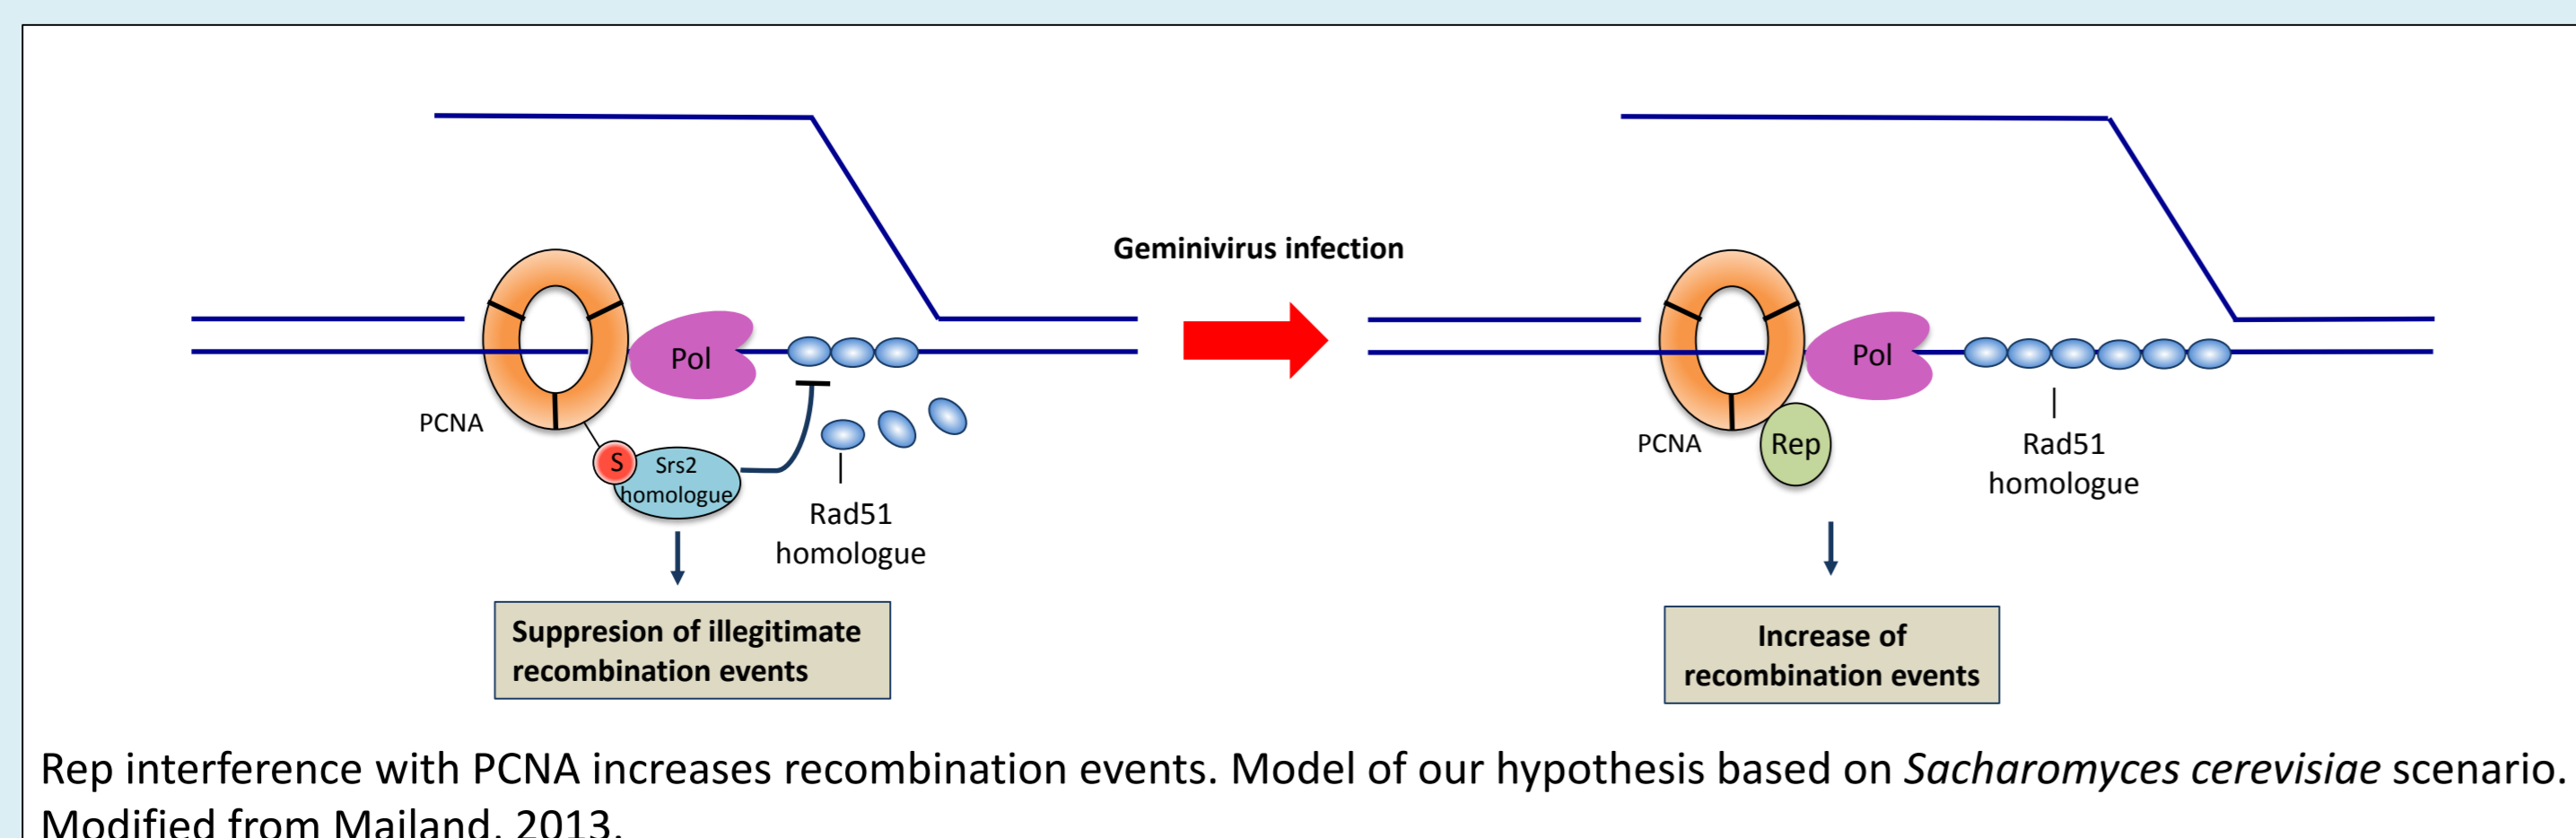

### Rep from TYLCV compromises sumoilation of tomato PCNA in planta

## HYPOTHESIS

Geminivirus genomes undergo high levels of mutation, recombination and reassortment to increase viral diversity (Duffy & Holmes, 2008). In *Saccharomyces cerevisiae*, sumoilated PCNA binds Srs2, anti-recombinogenic protein that suppresses recombination during DNA replication by interfering with Rad51 and binding to DNA single strands formed in the replication fork (Veaute *et al.*, 2003). Rep interferes with PCNA by decreasing PCNA-sumoilated levels, which could explain the increase of viral recombination rate.

## CONCLUSIONS

- Rep specifically interferes with PCNA sumoilation.
- PCNA lysines 164 and 254 are sumoilated and Rep interferes with the sumoilation of both residues.
- PCNA is sumoilated with AtSUMO1 and AtSUMO2 but not with AtSUMO3.
