Advantages of regenerative braking

- Recovery of energy during the braking process
- Control of the wheel torque

without having to add additional components to the system

Disadvantages of regenerative braking

- The system is not normally large enough to provide the braking torque demanded by the driver
- The angular speed of the motor, the batteries state of charge (SoC) and other factors must also be taken into account

The installation of a friction braking system is still necessary

Advantages of regenerative braking

- The angular speed of the motor, the batteries state of charge (SoC) and other factors must also be taken into account

The installation of a friction braking system is still necessary

Outline

Efficiency

Safety

A study must be made of the dynamics of both systems to see how it affects the safety of the vehicle

Real vehicle characteristics

Component	Parameter	Description
Vehicle	Motorcycle weight	135 Kg
	Chassis Type	Steel Tubular
	Height of gravity centre	621 mm
	Distance between axis	1370 mm
	Wheel radius	300 mm
	Distance from the COG to the front axle	670 mm
	Front tire	95/70 R 17
	Rear tire	115/70 R 17
Electric motor	Brand	Heinzmann PMS 150
	Type	Axial Flux Permanent Magnet
	Maximum speed	6000 rpm
	Maximum torque	80 Nm
	Torque constant (K_m)	0.145 Nm/A
	Maximum power	34.1 KW (46.36 CV)
Battery	Battery Type	LiPo
	Cell layout	26S5P
	Total capacity	4.8 KWh
	Rated Voltage	96 V
	Maximum discharge current	1250 A
	Maximum load current	300 A

Proposed regenerative system

Classic brake distribution

Proposed brake distribution minimizing the delay of the electric regeneration system

When the regenerative brake starts to take effect, the friction brake adapts to maintain the torque target.

2. Real vehicle characteristics / System components
3. Tests performed
4. Proposed regenerative system
5. Simulations
6. Real test
- 7. Conclusion**

Conclusion

We have studied the dynamics of a by-wire friction braking system and a regenerative braking system

Three different types of braking systems installed on the motorcycle used to carry out the tests

Step and sinusoidal control signals were introduced and the response of both systems has been compared

Our hydraulic system is much faster than our regeneration system

Conclusion

The main objective is to regenerate the maximum energy possible without affecting safety

A combination algorithm of both systems has been proposed

We have proved that it is essential to take these dynamics into account when designing braking control systems, such as the ABS braking system.
